Chapter 0 Introduction

0.1 Purpose and Scope

This Playbook is the definitive operational and training reference for Recruitment Pack and Affordability Pack strategy across all Swire Coca-Cola (SCC) markets. It is designed to be picked up independently by any RGM practitioner at any level, in any market, without reliance on facilitator support.

The document covers the full commercial lifecycle: from initial market diagnosis through pack design, commercial deployment, performance measurement, and capability certification. It is structured to serve both as a practical working guide for day-to-day RGM decision-making and as the curriculum backbone for the five-stage Training and Certification Programme.

[PRINCIPLE] Recruitment and Affordability packs are not a universal solution. They are a targeted, evidence-based response to specific consumer and market conditions. This Playbook equips practitioners to determine when, where, and how to deploy them — and equally, when not to.

0.2 Who Should Use This Playbook

This Playbook is written for global applicability across all market income levels, trade structures, and channel configurations. Content is transferable between developed and emerging markets, modern trade and traditional trade, high-income and low-income consumer segments.

Role	Primary Chapters	Training Stage
Associate / Analyst	Ch.0, Ch.1, Ch.2	Stage 1 — Foundation
Manager / Senior Analyst	Ch.2, Ch.3, Ch.6	Stage 2 — Market Diagnosis & Analytics
Senior Manager	Ch.3, Ch.4, Ch.7	Stage 3 — Pack Design & Business Case
RGM Lead	Ch.4, Ch.5, Ch.7, Ch.8	Stage 4 — Commercialization & Execution
Regional / Global RGM	All chapters	Stage 5 — Certification
Finance / Supply Chain	Ch.3, Ch.4, Ch.7	Reference — no certification required
Marketing / Category	Ch.1, Ch.2, Ch.3	Reference — no certification required

0.3 Playbook Navigation Map

Figure 0.1 — Playbook Navigation Map: role-based reading guide by chapter

0.4 How This Playbook Was Built

This Playbook synthesises source materials drawn from: the Swire Coca-Cola RGM Capability series; the Coca-Cola system RGMX @ Scale learning sessions; global Market Performance Awards case studies; and market-level pack initiative documentation spanning Vietnam, Taiwan, Cambodia, Philippines, India, Indonesia, Singapore, Pakistan, Turkey, Georgia, Europe (Spain and Greece), and Australia. All illustrative cases not drawn from verified source data are clearly marked [ILLUSTRATIVE CASE].

0.5 Key Definitions

Term	Definition
Recruitment Pack	A pack designed primarily to acquire new consumers into the brand or category by removing the trial barrier through an affordable entry price point, smaller serve size, or both. Success is measured by incremental transaction and penetration growth, not volume alone.
Affordability Pack	A pack designed to retain existing consumers whose purchasing power has been eroded by inflation or income pressure, by maintaining an accessible price point, typically through resizing or repricing an existing format.
OBPPC	Occasion — Brand — Pack — Price — Channel. The strategic framework linking pack decisions to consumer occasion, brand role, price architecture, and channel-specific execution requirements.
Entry Price Point (EPP)	The lowest affordable transaction price at which a consumer can engage with the brand or category, calibrated to a Magic Price Point in the local market.
Magic Price Point	A psychologically significant price threshold (e.g., IDR 3,000; INR 20; PKR 100) at which consumer transaction propensity increases disproportionately. Market-specific and inflation-sensitive.
Incremental Volume	Volume genuinely added to the system through new consumers or new occasions, not transferred from existing packs or channels. The primary measure of recruitment pack success.
Cannibalization	Volume transferred from existing, typically higher-margin packs to a new recruitment pack. Must be modelled and bounded before launch approval.
DDI	Daily Disposable Income. The primary affordability benchmark. A pack is considered affordable when its price represents 3–6% or less of local DDI (varies by market context).
CEP	Consumer Entry Point. The price or pack at which a new or lapsed consumer first engages

Term	Definition
	with the brand or category in a given channel.
NSR	Net Sales Revenue. Total revenue after trade discounts, allowances, and applicable taxes. The primary revenue performance metric for pack initiatives.

0.6 Skipped Files Log

The following file types were identified in the source folder but excluded from this Playbook per the stated file-type rules:

- Video files (.mp4, .mov): 6 files excluded — Taiwan OBPPC Training (3 files), Taiwan OBPPC Orientation, RGM Marathon Solutions Meeting recording, and related training videos.
- Audio files (.mp3, .wav, .m4a): 0 files identified.
- Image files (.jpg, .jpeg, .png): multiple image assets excluded.
- Archive files (.zip, .rar): 0 files identified.
- Subtitle files (.srt): 2 files excluded (RGM Marathon Solutions Meeting; RGM Academy Arca TPO Sharing).
- Files in Chinese only (no English content extractable): several PPTX and DOCX files in the RGM Monopoly Game folder were partially excluded. Key principles have been incorporated where English content was present.

The Global OBPPC Playbook Affordability PDF (20231201_Global_OBPPC_Playbook_Affordability.pdf) returned no extractable text in the automated scan. Principles from this framework have been incorporated from parallel source materials where they were explicitly referenced. Full content from this file should be verified by the RGM CoE before the next Playbook revision.

[FLAG: additional input required — Global_OBPPC_Playbook_Affordability.pdf returned empty text extraction. Manual review required; content from this file may not be fully represented in this Playbook version. RGM CoE to verify coverage against the original before publication.]

Chapter 1 Strategic Foundation

1.1 The Two-Engine Growth Model

Revenue growth in sparkling and non-alcoholic ready-to-drink (NARTD) categories is driven by two distinct but complementary mechanisms. The first is retention: protecting and deepening value with existing consumers through frequency, occasion breadth, and portfolio premiumization. The second is recruitment: expanding the consumer base by bringing in new or lapsed buyers who are currently outside the system due to price, pack format, or occasion barriers.

[PRINCIPLE] Neither engine is optional. Markets that focus exclusively on premiumization without solving recruitment face long-term penetration decline. Markets that deploy affordability packs without a premiumization anchor risk accelerating mix deterioration. The two engines must run simultaneously, with deliberate portfolio management to prevent one undermining the other.

This Playbook focuses on the recruitment engine — specifically the role of Recruitment and Affordability Packs in expanding the consumer base and protecting volume during periods of affordability pressure. However, every pack decision described here must be evaluated in the context of its impact on the full portfolio and the premiumization agenda.

Europe provides a clear illustration of this dual imperative. In markets such as Spain and Greece, the system demonstrated that a "surgical and both-and" approach — protecting heavy buyers with upsized packs while simultaneously recruiting medium and light buyers through entry formats — delivered measurably superior results to either strategy deployed in isolation. The framework described in this chapter governs how that balance is achieved at the market level.

1.2 OBPPC and Pack Role Architecture

Recruitment and Affordability Packs do not exist in isolation. They are nodes within a broader OBPPC architecture that assigns a distinct strategic role to every pack in the portfolio.

Pack Role	Strategic Intent	Primary Metric	Pricing Logic
Entry / Recruitment Pack	Acquire new consumers; lower the trial barrier through price or portion	Incremental transactions; penetration uplift among new buyers	Price anchored to Entry Price Point (EPP) and DDI benchmark; Magic Price Point preferred
Frequency Pack	Drive repeat purchase by existing light-to-medium buyers; grow occasions	Transaction frequency; volume per buyer	Indexed to competitive field; value vs. per-liter price
Convenience Pack	Serve on-the-go, single-serve, impulse occasions; maximize cold availability	Ice-cold availability; outlet compliance; impulse conversion rate	Premium over at-home equivalent; occasion justified
Value / Bulk Pack	Capture at-home, stock-up occasions; protect heavy buyers; compete on per-liter value	Household penetration; at-home share; per-liter price competitiveness	Low absolute price per liter; affordability anchor for heavy buyers
Premium / Occasion Pack	Premiumize; build brand equity; capture high-value occasions (gifting, dining, celebration)	NSR per case; category value share; brand equity score	Premium positioning; differentiated pack architecture (e.g., sleek can, glass)

[PRINCIPLE] Each pack must have a single primary role. Dual-role packs — attempting to serve both entry and frequency purposes simultaneously — typically underperform on both. The most common failure pattern is deploying a pack that is too large to serve as a genuine entry pack (high absolute price) but too small to deliver frequency value, occupying an undefined position in the portfolio.

1.3 The OBPPC Logic Tree

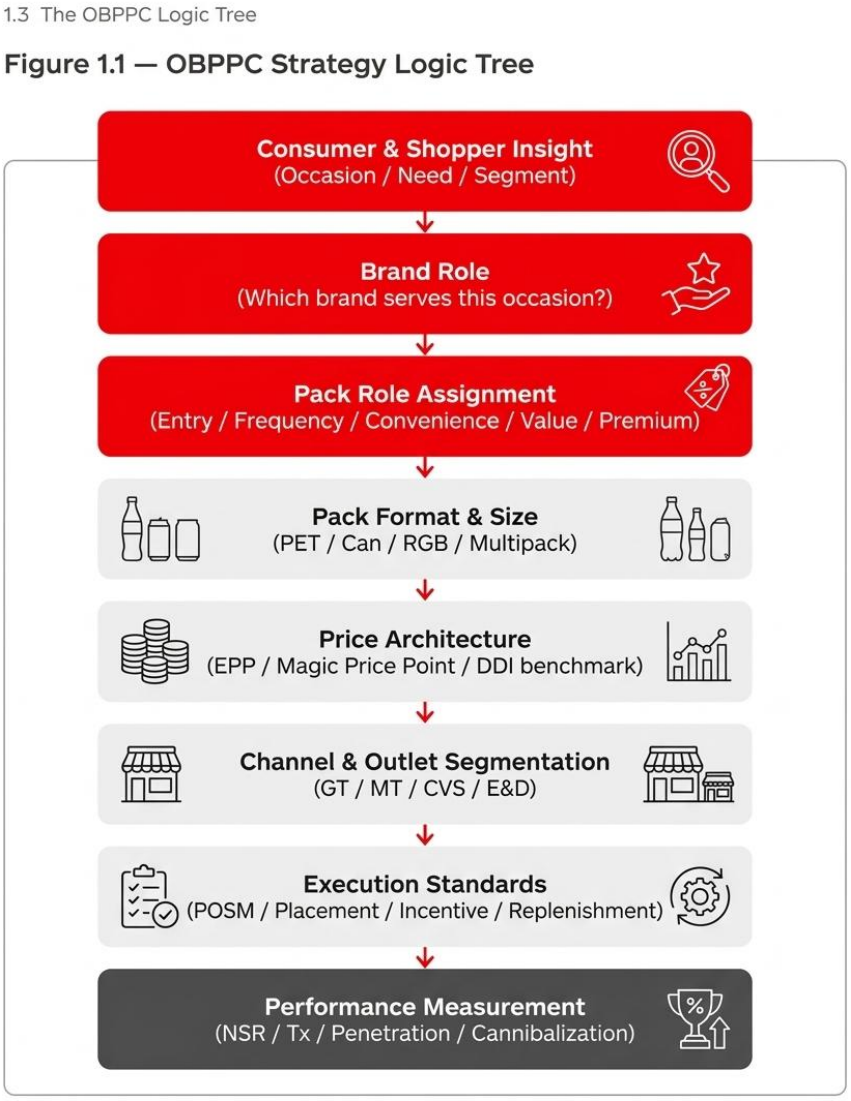

Figure 1.1 — OBPPC Strategy Logic Tree

1.4 Recruitment Pack vs. Affordability Pack — Critical Distinction

The most common strategic error in pack deployment is conflating Recruitment and Affordability objectives. The two are related but fundamentally different in intent, target consumer, and success criteria. Treating them as interchangeable leads to misdirected investment and misread results.

Dimension	Recruitment Pack	Affordability Pack
Primary objective	Acquire new consumers into the brand or category	Retain existing consumers under affordability pressure
Target consumer	Non-buyers or lapsed buyers; light category users	Existing buyers at risk of trading down or exiting
Core barrier addressed	Trial barrier: price or portion too large for first purchase	Ongoing access barrier: regular pack no longer affordable
Pack design starting point	Entry transaction price; smallest viable serve	Existing consumer behavior; acceptable downsize without devaluing brand

Dimension	Recruitment Pack	Affordability Pack
Primary success metric	Incremental transactions; penetration growth among new buyers; cannibalization rate below threshold	Volume retention; heavy buyer protection; transaction frequency maintenance
Cannibalization expectation	Low (targeting non-buyers); closely monitored; threshold set pre-launch	Moderate (replacing existing pack); modelled and accepted as structural shift
Margin posture	Acceptable lower gross margin per unit if system economics positive at scale	Margin maintained or improved through pack resizing or cost optimization
Channel priority	Traditional trade, convenience, channels where new consumers shop	All channels; prioritize channels where heavy buyers over-index
Measurement horizon	6–12 months: incremental buyer acquisition rate	3–6 months: volume retention; 12–18 months: NSR mix impact

1.5 Do / Do Not Reference Table

Do	Do Not
Start pack design from target transaction price (EPP), then work back to optimal pack format and size.	Start from existing pack formats and apply a discount. This generates affordability without genuine entry-point innovation.
Validate the DDI benchmark in-market before setting the EPP. DDI thresholds vary significantly between market contexts (e.g., urban vs. rural; GT vs. MT).	Apply a global DDI threshold without local calibration. What is affordable in Karachi is not affordable in Ho Chi Minh City.
Model cannibalization explicitly before launch approval. Set a threshold. Monitor against it in the first 90 days.	Assume cannibalization will be negligible. In most markets, 20–40% of recruitment pack volume is drawn from adjacent existing packs. This must be quantified.
Assign the pack a single role. Brief the entire commercial team on that role so execution is consistent.	Let the pack "drift" between roles. Entry packs placed in premium cooler bays, or priced above the EPP at outlet level, lose their recruitment function.
Size the opportunity against realistic incremental volume — not total category volume. Penetration headroom and channel reach are the binding constraints.	Project recruitment pack volume as a percentage of total category size without channel-by-channel build-up. These projections are consistently overstated.
Define exit criteria before launch. If the pack does not meet recruitment thresholds within the pilot window, have a pre-agreed response: fix, pivot, or exit.	Allow a failing pack to persist without diagnosis. The most costly outcome is a pack that creates margin dilution without incremental consumer value.
Integrate the recruitment pack into the full OBPPC architecture. Ensure it does not cannibalize your frequency anchor pack.	Launch a recruitment pack in isolation from the portfolio. Consumer and trade confusion results when pricing logic is not coherent across pack sizes.

1.6 The Revenue Growth & Margin Expansion (RGMX) Context

The Coca-Cola system is in active transition from RGM 1.0 (revenue growth) to RGMX (revenue growth and margin expansion). This evolution has direct implications for how Recruitment and Affordability Packs are evaluated and approved.

Under RGM 1.0, a pack that grew volume and market share was often approved regardless of its gross margin contribution. Under RGMX, margin expansion is an explicit co-equal objective alongside revenue growth. Recruitment packs must therefore demonstrate not just incremental volume, but a credible path to positive system economics — taking into account the full value chain from production cost through customer margin to consumer price.

Dimension	RGM 1.0 Lens	RGMX Lens
Pack approval criterion	Volume and market share accretive	Volume AND margin accretive; system economics positive
Cannibalization tolerance	Accepted if net volume is positive	Cannibalization must not disproportionately erode mix; NSR per case benchmark applies
Consumer insight weight	Important but secondary to trade and volume	Equal weight; consumer occasion and penetration data drive pack design
Cross-functional integration	RGM-led with Finance sign-off	Cross-functional from day one: Marketing, Finance, Supply Chain, Customer, Bottler
Measurement cadence	Annual review	Leading indicators at 30/60/90 days; rapid optimization loop

The practical implication: in the RGMX era, a Recruitment Pack that grows transactions but destroys system margin is not a success. The business case must close at the system level, not just at the consumer or trade level.

1.7 Pack Role Positioning — OBPPC Architecture Diagram

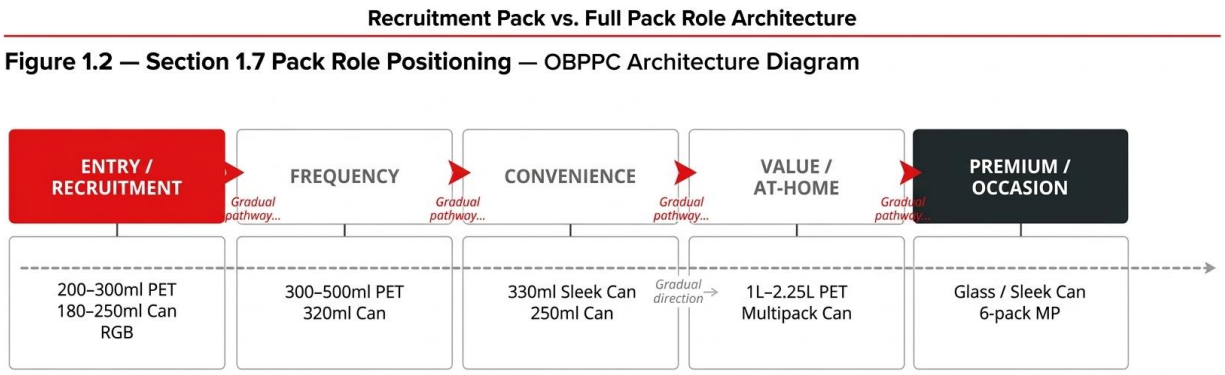

Figure 1.2 — Recruitment Pack vs. Full Pack Role Architecture

1.8 Key Assumptions and Risk Flags

Key Assumption: This Playbook assumes that market RGM teams have access to Nielsen or equivalent panel data covering category penetration, price-pack elasticity, and channel-level share. Where this data is unavailable, proxy methods are described in Chapter 2. However, pack decisions made without penetration data carry elevated risk of over-projecting incremental volume.

Risk: The global affordability context is shifting rapidly in 2025–2026. Inflation in key Swire Coca-Cola markets (Vietnam, Cambodia, Thailand) has compressed consumer discretionary income and elevated the relative cost of existing entry packs. DDI benchmarks and Magic Price Points must be recalibrated annually. Playbook users should not apply DDI thresholds from prior years without verification.

Chapter 2 Market Diagnosis

2.1 Purpose of Market Diagnosis

The single most common failure mode in pack strategy is deploying the wrong solution to the right problem, or a correct solution to the wrong problem. Market Diagnosis is the structured analytical process that prevents both errors. It produces a definitive answer to four questions before any pack design work begins:

- What type of problem does this market have — brand problem, price problem, pack problem, or execution problem?
- Is there genuine incremental volume to capture, or would a new pack primarily cannibalize existing portfolio?
- Where is the opportunity — which consumer segment, which channel, which occasion?
- Is a pack intervention the right response, or is another RGM lever more appropriate?

Skipping or compressing this step has predictable consequences: over-estimated volume projections, under-estimated cannibalization, wrong channel prioritization, and pack designs that fail to solve the underlying consumer barrier.

2.2 Five-Step Diagnosis Process

Figure 2.1 — 5-Step Market Diagnosis Flowchart

Step 1: Affordability Context

Establish the macro affordability baseline before conducting any category or brand analysis. This step calibrates what "affordable" means in this market, for this consumer segment, at this point in time.

Input	Source	What It Tells You
Daily Disposable Income (DDI) by consumer segment	Nielsen Household Panel; government statistical data; OU Finance	Absolute affordability ceiling. Benchmark: entry pack should represent 3–6% of DDI in most emerging markets.
Inflation trend (food & beverage, 12–24 months)	Central bank / statistical bureau data	Rate at which purchasing power is being eroded. Rapid inflation compresses DDI faster than price adjustments can track.
Income segment distribution by geography	Household panel; census data	Identifies where affordability-constrained consumers concentrate — critical for channel prioritization.
Historical pack-price index	Internal pricing data vs. CPI trend	Shows whether pack prices have risen faster or slower than consumer income. Gap = affordability stress signal.

Affordability Index = (Current Pack Price ÷ Local Magic Price Point) × 100. An index above 110 signals meaningful affordability stress requiring intervention. Below 90 signals headroom to premiumize rather than discount.

Step 2: Category and Brand Participation Analysis

Establish whether the market has a participation gap (consumers who could buy but do not) and whether that gap is driven by price, brand, or product availability.

Metric	Definition	Diagnostic Signal
Category Penetration	% of households that purchased any NARTD SSD in the past 3 months	Below 40% in most emerging markets = significant headroom; above 70% = penetration-mature, focus on frequency and premiumization
Brand Penetration	% of households that purchased the specific brand in the past 3 months	Gap between category pen and brand pen = competitive loss or occasion-specific underperformance
Entry-Point Participation	% of category buyers who purchased a pack below the EPP threshold	Low entry-point share = price barrier is blocking recruitment; high entry-point share with flat penetration = brand or equity barrier
Purchase Frequency	Average purchases per buyer per year	Low frequency among existing light buyers = occasion gap; address with frequency pack, not entry pack
Lapsed Buyer Rate	% of prior buyers who did not purchase in the past 6 months	High lapsed rate + affordability stress = affordability pack priority; high lapsed rate without affordability stress = equity or execution issue

Step 3: Price-Pack Ladder Mapping

Map the full price-pack landscape — your portfolio and all competitive packs — against each channel to identify gaps, white space, and Consumer Entry Point alignment.

Price Point (Local Currency)	Your Pack	Pack Size	Pack Type	Channel	CEP Status	Competitive Occupancy
[Enter threshold]	[SKU name]	[ml]	[PET/Can/RGB]	[GT/MT/CVS/E&D]	[Entry / Mid / Premium]	[Occupied / Gap / White space]

Price Point (Local Currency)	Your Pack	Pack Size	Pack Type	Channel	CEP Status	Competitive Occupancy
[Enter threshold]						
[Enter threshold]						
[Enter threshold]						

Complete this table for each major channel. Gaps in your portfolio at or below the local Magic Price Point, where competitors are present, represent priority recruitment pack opportunities.

Step 4: Channel and Occasion Diagnosis

Affordability and recruitment dynamics operate differently across channels. A pack that solves the problem in modern trade may not solve it in traditional trade, and vice versa.

Channel	Consumer Profile	Key Diagnostic Question	Primary Pack Response
General Trade (GT)	Price-sensitive, cash-in-hand consumers; daily purchase pattern; low basket size	Is there a pack at or below the local cash-in-hand threshold (typically 1–3 units of daily spend)?	Smallest affordable single-serve; RGB; low-unit-count multipack
Modern Trade (MT)	Higher-income shoppers; larger basket; planned purchase; value comparison by PPL	Is your PPL competitive vs. category alternatives at every shelf tier?	Entry multi-serve; value pack; upsized PET anchored to PPL competitiveness
Convenience / CVS	On-the-go, impulse, younger consumers; cold consumption priority	Is there a chilled pack at a price accessible to the target young consumer segment?	Mini can; small PET; price at or below local CVS Magic Price Point
E&D (Eating & Drinking)	Occasion-driven; lower price sensitivity vs. GT; meal-pairing priority	Is the glass RGB / serve format available at a price that does not deter trial?	Single-serve glass or small PET; price benchmarked to meal occasion, not GT price
Online / E-Commerce	Bulk purchase, household stock-up; value-per-liter comparison	Is there a bundle or multipack that delivers at-home value without undercutting channel economics?	Multipack; value bundle; PPL competitive vs. GT and MT

Step 5: Problem Classification and Go / No-Go Decision

The diagnostic must conclude with a clear problem classification before any pack solution is considered. The most common error is solving a brand problem with a pack solution, or an execution problem with a pricing change.

Problem Type	Diagnostic Indicators	Correct Response	Pack Response?
Brand Problem	Penetration flat despite competitive price; brand equity scores declining; lapsed buyer rate rising independently of price	Marketing and brand activation; consumer occasion communication; not a pack solution	No — pack will not solve a brand equity deficit
Price Problem	Penetration declining as prices rose above affordability threshold; transaction loss correlated with price index	Entry pack at EPP and/or Magic Price Point; affordability pack resizing	Yes — this is the primary use case

Problem Type	Diagnostic Indicators	Correct Response	Pack Response?
	movement; consumer research confirms price barrier		
Pack Problem	Consumer willing to buy but citing wrong format, wrong size, or wrong occasion fit; competitive packs at same price outperforming	Pack format redesign; occasion-aligned size innovation	Yes — but design must start from consumer occasion, not price alone
Execution Problem	Distribution gaps in target channels; poor cold availability; POSM absent; outlet compliance below standard	Execution standards enforcement; RED compliance; distribution drive	No — a new pack will fail for the same execution reasons as the existing pack

2.3 Go / No-Go Decision Tree

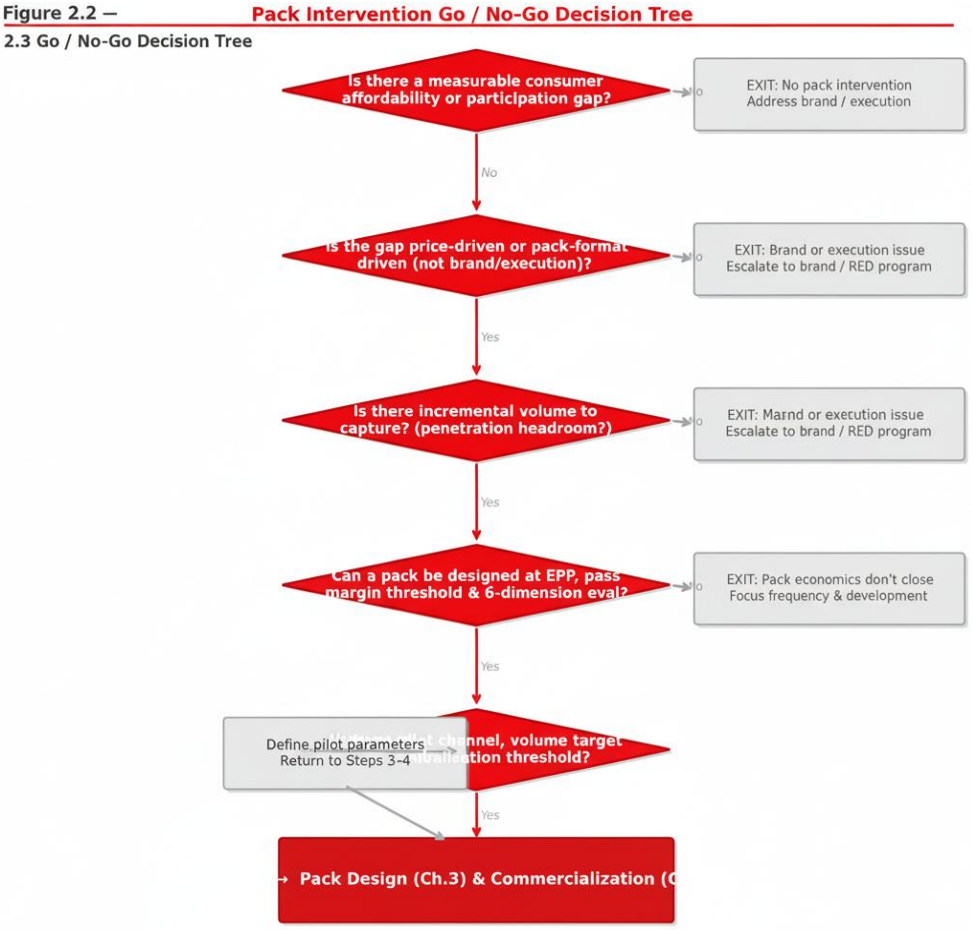

Figure 2.2 — Pack Intervention Go / No-Go Decision Tree

2.4 Opportunity Heatmap — Channel and Segment

Use this heatmap framework to summarize diagnostic findings across consumer segments and channels. Complete one for each market before proceeding to pack design. Cells are rated High / Medium / Low based on the size of the identified gap and the feasibility of a pack response.

```
[ASCII GRID — Opportunity Heatmap by Channel and Consumer Segment]
```

Segment → Channel ↓	Non-Buyer / Lapsed	Light Buyer	Medium Buyer	Heavy Buyer
General Trade	HIGH — primary recruitment target; EPP-driven	MEDIUM — occasion expansion needed	LOW — frequency already adequate	LOW — protect with value pack
Modern Trade	MEDIUM — penetration opportunity in at-home	HIGH — multipack value; PPL competitive	MEDIUM — upselling opportunity	HIGH — bulk value; heavy buyer retention
Convenience / CVS	HIGH — impulse recruitment; cold entry pack	HIGH — occasion expansion on-the-go	MEDIUM	LOW
Eating & Drinking	HIGH — meal occasion trial; low perceived risk	MEDIUM — build frequency in dining occasion	LOW	LOW
Online / E-Commerce	LOW — not typical first purchase channel	MEDIUM — value bundle introduction	HIGH — bulk value; automatic repurchase	HIGH — subscription / bulk program

2.5 Key Assumptions and Risk Flags

Key Assumption: The diagnosis framework in this chapter assumes that consumer research data (penetration, frequency, occasion, price sensitivity) is available at minimum at Nielsen/Kantar panel level. Where panel data is unavailable — as is common in Cambodia, parts of Vietnam GT, and smaller markets — proxy approaches using distributor sell-out data, outlet audit results, and management estimates are acceptable for initial hypothesis generation but must be flagged as lower-confidence inputs in the business case.

[FLAG: additional input required — Vietnam General Trade: As of early 2026, approximately 66% of promotional spend in VN is untracked at the off-invoice level (Actual=0 for all off-invoice line items in the SAP system). This significantly limits the ability to model cannibalization accurately in GT channels. Until SAP CCS is mandated for VN off-invoice tracking, Vietnam-specific cannibalization projections should carry a wide confidence interval (±20–30%).]

Chapter 3 Pack Design Framework

3.1 Design Principles

Pack design for Recruitment and Affordability purposes is an evidence-based process governed by six dimensions of evaluation. The three most common design errors are: (1) starting from an existing pack and applying a price reduction without changing the format; (2) designing from a production-cost perspective rather than a consumer-transaction perspective; (3) optimizing for one dimension (e.g., Consumer Fit) while neglecting others (e.g., Operational Fit or Economic Fit).

[PRINCIPLE] Design starts from the target transaction price — not from the pack. Establish the EPP first. Then determine what volume, format, and pack type delivers the right serve experience at that price while meeting minimum system economics. This is the reverse of how packs have traditionally been designed in the Coca-Cola system, and it is the single most impactful discipline change available to a market RGM team.

Taiwan's CVS Mini CAN recruitment proposal (2025) exemplifies this principle: the team started with the observation that 55% of ambient sweetened tea in CVS sells at or below NT$20, established this as the Magic Price Point for the target young consumer segment, and then designed backward to a 200ml format that could be delivered at NT$13.5 average price with acceptable Swire margin and customer economics.

3.2 The Six-Dimension Evaluation Framework

Figure 3.0 – Six-Dimension Evaluation Framework

Section context: 3.2 The Six-Dimension Evaluation Framework

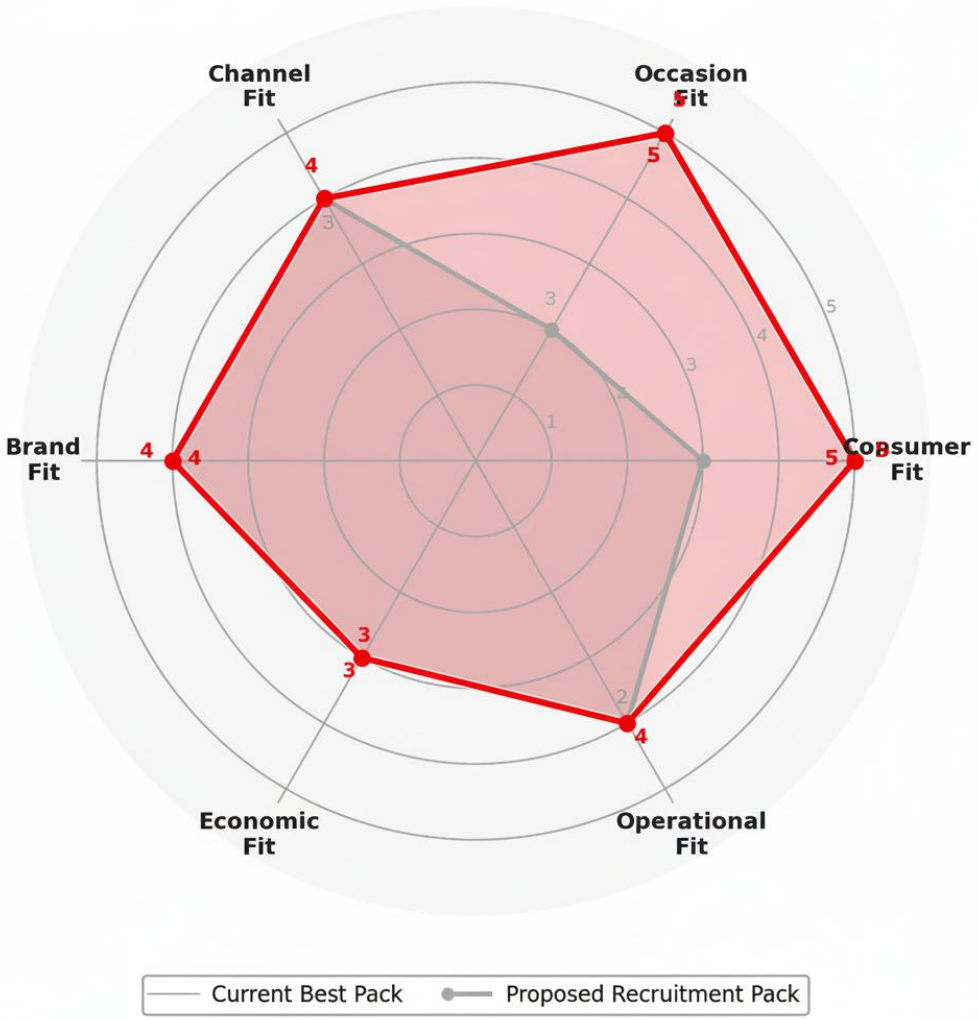

Figure 3.0 — Six-Dimension Evaluation Framework: Spider Chart

Dimension	Key Questions	Minimum Standard for Launch Approval
Consumer Fit	Does the pack size match the target consumer's typical consumption occasion? Does the price point sit at or below the EPP for the target segment? Does consumer research confirm willingness to trial?	Conjoint or validated consumer research showing ≥20% trial intent among target non-buyers or lapsed buyers at the proposed EPP.
Occasion Fit	Is the pack designed for a specific, identifiable consumption occasion? Does the format (e.g., chilled can vs. ambient PET) match how the consumer will consume it?	Clear occasion definition backed by consumer research. No dual-occasion designs that blur channel execution.
Channel Fit	Is the pack and its price visible and executable in the priority channel? Does the pack fit distributor case configuration? Is cold infrastructure available where required?	Distribution targets achievable with current RTM infrastructure within 90 days of launch. Cold requirement confirmed if applicable.
Brand Fit	Does the pack reinforce or at minimum not damage brand equity? Does the price point sit above any brand-defined minimum price floor? Is the pack format consistent with brand visual standards?	No pricing below defined brand price floor. Pack design reviewed and approved by Marketing/Brand.
Economic Fit	Does the pack generate positive system economics at the projected volume? Does GP margin per case meet the market threshold? Is the business case positive on NPV basis at Year 3?	GP margin per case ≥ market-defined threshold (typically 28–35%). Positive NPV at Year 3 at 80% of projected volume.
Operational Fit	Can the pack be produced, distributed, and replenished with current supply chain and RTM infrastructure? If new production capability is required, is the capex justified by the business case?	Supply chain readiness confirmed. No new production line required unless NPV case covers capex with ≥18-month payback.

3.3 Pack Design Sequence

3.5 Pack Evaluation Scorecard

Complete this scorecard for each pack option under consideration. Score each dimension 1–5. Minimum total score for business case progression: 20/30. Any dimension scoring 1 is a blocking factor regardless of total score.

Dimension	Score (1–5)	Weight	Weighted Score	Notes / Conditions
Consumer Fit		×2		Conjoint data required for score ≥ 4
Occasion Fit		×1		Occasion must be specifically defined
Channel Fit		×1.5		RTM readiness must be confirmed
Brand Fit		×1		Brand floor price must be confirmed
Economic Fit		×2		GP% threshold and NPV must be modelled
Operational Fit		×1.5		SC confirmation required for ≥ 4
TOTAL		/30 weighted		Minimum 20/30 to proceed

3.6 Business Case Template

Section	Content Required
1. Market Context	Market DDI, category penetration (current), brand penetration (current), identified gap, problem classification (price/pack/brand/execution)

Section	Content Required
2. Pack Proposal	Pack name, format, size, proposed EPP, proposed RSP, channel priority, target consumer segment
3. Volume Estimate	Year 1 incremental volume projection (units and cases), source of volume build (penetration uplift × reach × frequency), cannibalization assumption and threshold
4. System Economics	WSP, PC (production cost), GP per case, GP%, DME/investment required, break-even volume, NPV Year 1–3 (base / upside / downside scenarios)
5. Customer Proposition	Customer margin per case, front margin %, trade investment required, retailer rationale
6. 6-Dimension Score	Completed scorecard from Section 3.5 with supporting evidence for each dimension rating
7. Pilot Design	Pilot channel(s), pilot geography, target outlet count, pilot duration (recommended minimum 90 days), success criteria (KPIs and thresholds)
8. Cannibalization Plan	Which existing packs will be affected? Projected cannibalization rate (% and UC). At what cannibalization rate does the business case no longer close? Pre-agreed monitoring cadence.
9. Risk Assessment	Top 3 risks to volume achievement; top 3 risks to margin; mitigation for each; go/no-go review trigger

3.7 Price Bridging and EPP Identification

The Entry Price Point (EPP) is not simply the cheapest price on the shelf. It is the specific transaction price at which the identified consumer barrier is removed — derived from the intersection of the local DDI benchmark, the competitive Magic Price Point, and conjoint-validated consumer willingness-to-trial data.

Market	DDI Benchmark (approx.)	Affordable Pack Price (3–5% DDI)	Local Magic Price Point Range	Notes
Vietnam	VND 160,000–180,000/day (2025)	VND 4,800–9,000	VND 5,000–8,000	DDI rising but inflation compressing real purchasing power; GT GT entry most sensitive
Taiwan	NT$350–500/day	NT$10–25	NT$16–22 (CVS context)	CVS channel dominates recruitment; Mini CAN target NT$13.5–16 average price
Cambodia	USD 5–8/day (urban)	USD 0.15–0.40	KHR 1,000–1,500 (USD 0.25–0.37)	KHR 1,000 price point critical for GT; CSD 580ml at KHR 1,500 for volume
Indonesia	IDR 80,000–120,000/day	IDR 2,400–6,000	IDR 3,000–5,000	ASSP technology enables 250ml PET at IDR 3,000; first ASP market with this capability
Pakistan	PKR 800–1,200/day	PKR 24–60	PKR 50–100	PKR 100 magic price for FC; IC entry at PKR 30–50 during high-inflation pressure
India	INR 400–600/day (urban)	INR 12–30	INR 20 (250ml PET); INR 50 (1L home pack)	250ml PET at INR 20 target = 1 billion incremental transactions/year

Market	DDI Benchmark (approx.)	Affordable Pack Price (3–5% DDI)	Local Magic Price Point Range	Notes
				projection
Singapore	SGD 80–120/day	SGD 0.40–1.00	SGD 0.50	Developed market; 50-cent price point for CSD No Sugar entry still relevant for light buyers

Important: DDI benchmarks are indicative and market-specific. They must be recalibrated annually in high-inflation environments. The 3–5% DDI guideline is a starting point for analysis, not a universal rule. In some low-income rural GT contexts, 2% DDI may be the operative ceiling. Always validate with local consumer research.

3.8 Key Assumptions and Risk Flags

Key Assumption: The six-dimension framework assumes that a formal conjoint study or validated consumer research exists for Consumer Fit scoring above 3. In markets where conjoint data is unavailable, proxy indicators (e.g., price ladder analysis, competitive pack volume comparison, management estimate) may be used but must be flagged as lower-confidence inputs. Consumer Fit scores above 3 without research validation require sign-off from the regional RGM lead.

[FLAG: additional input required — Operational Fit validation in Vietnam (RGB): The Vietnam RGB project (2023) identified that the required supply chain infrastructure — production lines, bottle washer, logistics, crate investment, glass seeding — represents significant capex complexity. No pack design should be approved for Vietnam RGB until the supply chain readiness assessment is complete and NPV covers capex with an 18-month payback threshold. As of Q1 2026, this assessment was not complete.]

Chapter 4 Commercialization Blueprint

4.1 From Pack Decision to Market

Pack approval is the beginning of the commercial challenge, not the end of it. The majority of recruitment pack failures in the Coca-Cola system have not been strategy failures — they have been commercialization failures: correct pack, wrong execution. The five most common commercialization failure modes are: inadequate pre-launch channel readiness; sell-in without effective sell-out mechanics; missing or wrong POSM at point of purchase; price at outlet level deviating from the designed EPP; and replenishment gaps that create stockouts in the first 30–60 days when trial velocity is highest.

This chapter provides the full commercialization blueprint: pre-launch readiness, launch design, sell-in to sell-out mechanics, the five non-negotiable execution conditions, and a structured 90-day timeline.

The Spain affordability case (RGMX @ Scale, 2025) illustrates the commercialization imperative: the plan was aligned in October and launched January 2nd — a 10-week execution window — and succeeded because the system treated it as the #1 cross-functional priority, involving Legal, Finance, Marketing, Supply Chain, and the bottler from Day 1. Speed, system alignment, and "progress over perfection" were cited as the three critical success factors.

4.2 Pre-Launch Readiness Checklist

Category	Readiness Item	Owner	Status
Strategy	Pack role and EPP confirmed; business case approved at required level	RGM Lead	☐
Strategy	OBPPC updated to reflect new pack; pack role brief issued to all commercial functions	RGM Lead	☐
Supply Chain	Production capability confirmed; initial stock build completed	Supply Chain Lead	☐
Supply Chain	Case configuration and logistics unit confirmed with distributor(s)	Supply Chain / Sales Ops	☐
Supply Chain	First 90-day demand plan confirmed and locked in S&OP	Supply Chain / Finance	☐
Pricing	RSP confirmed and published by channel; EPP compliance mechanism in place	Commercial / RGM	☐
Pricing	Customer pricing and margin confirmed; trade investment letters/agreements issued	Commercial / Finance	☐
Execution	POSM brief issued; POSM in production; delivery timeline confirmed	Marketing / Trade Marketing	☐
Execution	Target outlet list by channel finalized; numeric distribution targets set	Sales Lead	☐
Execution	Distributor briefing completed; sales toolkit deployed	Sales Lead / Distributor Mgmt	☐
Execution	Retail incentive program designed and briefed	Trade Marketing	☐
RTM	RTM routing confirmed for target outlets; cold delivery capability assessed where required	RTM / Sales Operations	☐
Measurement	KPI dashboard set up; baseline data confirmed; tracking cadence agreed	RGM / Finance	☐

Category	Readiness Item	Owner	Status
Measurement	Cannibalization monitoring plan active; threshold set and shared with leadership	RGM Lead	☐
Governance	Launch steering committee formed; escalation path confirmed; 30-day review scheduled	RGM Lead / Commercial Director	☐

4.3 Five Non-Negotiable Execution Conditions

These five conditions are mandatory for any recruitment pack launch, in any market, in any channel. They are not aspirational standards — they are minimum conditions without which the pack cannot function as intended. A launch missing any one of these five conditions should be delayed until the condition is met.

Figure 4.0 — Five Non-Negotiable Execution Conditions

Figure 4.0 — Five Non-Negotiable Execution Conditions

Non-Negotiable	Minimum Standard	Most Common Failure Mode	Corrective Action if Missed
Right Outlet	Numeric distribution target in priority channel achieved before launch day. Minimum 60% of target outlets reached in Week 1.	Launching across all channels simultaneously without adequate coverage in any single channel — creating diffuse, low-impact presence.	Focus distribution drive; delay ATL/BTL communication until 60% ND threshold met.
Right Price	RSP at target EPP in 90%+ of audited outlets in pilot. Price compliance monitoring from Week 2.	Outlets charging premium above EPP (especially in traditional trade where pricing is less controlled). Recruitment pack becomes invisible at the planned price point.	Price communication at outlet level; distributor briefing on RSP enforcement; trade survey in first 30 days.
Right Visibility	Dedicated POSM placed in all priority outlets. Cooler facings secured where cold consumption is required. No buried or back-of-shelf placement.	POSM printed but not placed; or placed in wrong location (e.g., general merchandise area rather than NARTD zone).	Merchandiser compliance audit in first 14 days; POSM replacement where missing.
Right Incentive	Trade incentive or promotional mechanic active from launch day — either push incentive (distributor / outlet) or pull mechanic (consumer promotion).	Incentive designed but not activated at launch; retroactively added after poor initial offtake — too late to build early trial velocity.	Confirm incentive payment mechanics are operational before launch day. Trade survey confirms outlet awareness of incentive.
Right Replenishment	Replenishment frequency confirmed pre-launch. First 60	Strong trial in Week 1–2 creates unexpected sell-through;	Early-read inventory monitoring from Day 7; automatic replenishment trigger

Non-Negotiable	Minimum Standard	Most Common Failure Mode	Corrective Action if Missed
	days: maximum 3-day stockout tolerance. Zero stockout in CVS/MT.	replenishment cycle not adjusted; stockouts in Week 3–4 destroy trial momentum.	if outlet-level stock falls below 5 days of sales.

4.4 Sell-In to Sell-Out Closed Loop

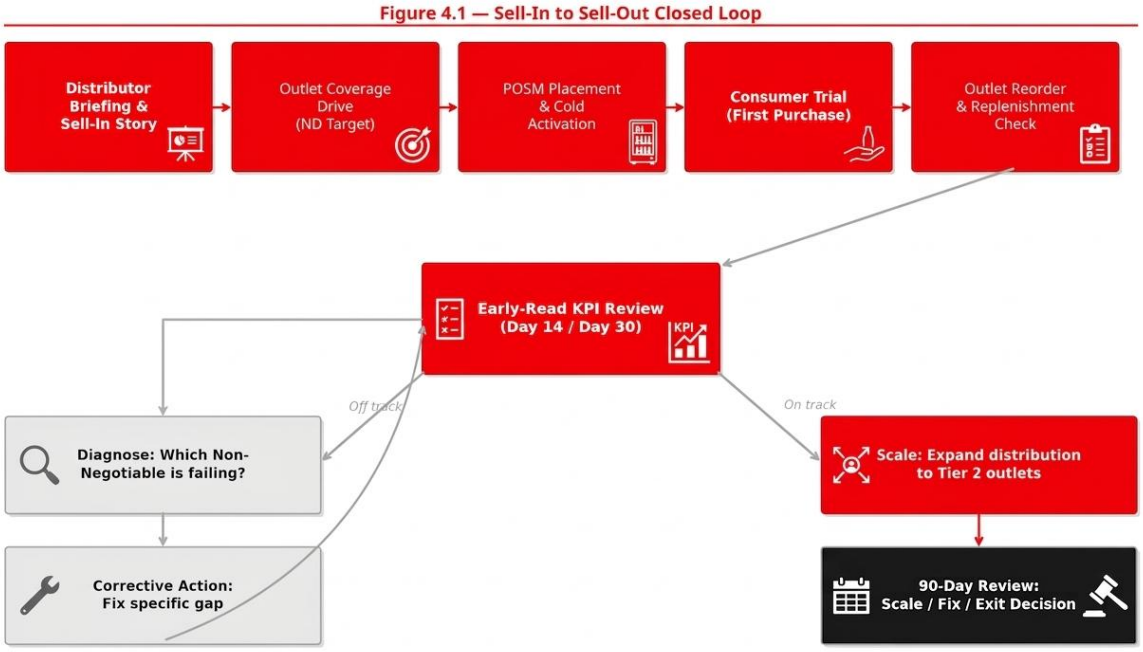

Figure 4.1 — Sell-In to Sell-Out Closed Loop

4.5 First 90-Day Launch Timeline

[ASCII GANTT — First 90 Days]

Week	Activity	Owner	KPI / Milestone
W–4 to W–1 (Pre-launch)	Distributor briefing; sales toolkit deployment; POSM production confirmation; trade incentive activation setup	Sales Lead / Trade Marketing	All distributors briefed; sales force trained; POSM in warehouse
W1–W2 (Launch)	Distribution drive to priority outlets; POSM placement; pricing confirmation audit; launch incentive activation	Sales Operations / Merchandising	≥60% numeric distribution in priority channel; EPP compliance confirmed in ≥80% of audited outlets
W2–W4 (Early Read)	Daily sell-out tracking in pilot outlets; cannibalization first read; distributor inventory review; POSM compliance audit	RGM / Sales Analytics	Trial rate vs. target; cannibalization within threshold; stockout rate <5%
W4–W8 (Stabilization)	Replenishment cycle optimization; outlet Tier 2 expansion begins; trade incentive effectiveness review; consumer trial to repeat rate assessment	Sales Lead / RGM	Repeat purchase rate ≥20% of trial buyers; ND Tier 1 ≥80%
W8–W12 (30/60/90	Full 90-day KPI review; cannibalization final	RGM Lead / Commercial	Volume vs. plan ≥80%;

Week	Activity	Owner	KPI / Milestone
Review)	assessment; Scale / Fix / Exit recommendation; national rollout planning if threshold met	Director / Finance	cannibalization ≤ threshold; NPV on track; Scale/Fix/Exit decision confirmed and communicated

4.6 Distributor Briefing and Sell-In Story Structure

Section	Content
1. Why now	Market context: consumer affordability gap, competitive white space, category growth opportunity. One page, data-driven.
2. The pack and its role	Pack name, EPP, channel role, and how it complements the existing portfolio (not replaces it). Addresses distributor concern about cannibalization of existing SKUs.
3. What's in it for the distributor	Incremental volume projection, distributor margin per case, any distribution incentive program, sell-in targets by outlet tier.
4. Execution standards	POSM requirements, placement standards, cold vs. ambient by channel, RSP at outlet level. Distributor is accountable for RSP compliance in their territory.
5. Measurement and reporting	How performance will be tracked, when the first review will happen, and what triggers bonus payout if an incentive scheme applies.
6. What happens next	Timeline to first delivery, reorder process, escalation contact for supply or pricing issues. No ambiguity on process.

4.7 Key Assumptions and Risk Flags

Key Assumption: The commercialization blueprint assumes a conventional bottler-distributor-outlet RTM model. In markets where direct-to-retail (DTR) or e-commerce channels represent a significant share of the target consumer's purchase occasion, additional channel-specific execution plans are required. The blueprint should be adapted accordingly by the market RGM Lead.

[FLAG: additional input required — Cambodia 580ml Coca-Cola launch (October 2025): The launch plan confirms KHR 1,500 RSP at MT and KHR 1,500 at key GT outlets, with a confirmed POSM program and sales motivation mechanics. However, numeric distribution target for GT was not confirmed in source documentation reviewed. Market RGM team to confirm ND target for GT before declaring full launch readiness.]

Chapter 5 Performance Measurement & Optimization

5.1 KPI Architecture

Effective performance management for recruitment and affordability packs requires a three-horizon KPI architecture. Leading indicators identify early signals within the first 30 days; mid-term indicators confirm whether the recruitment mechanism is working at 60–90 days; lagging indicators assess long-term business impact at 6–18 months.

[PRINCIPLE] Measuring only lagging indicators is the most common performance management failure. By the time volume or NSR shortfalls are visible in quarterly data, the pack has either failed in-market with compounding damage (distribution rollback, customer skepticism, wasted trade investment) or succeeded without the team understanding why — preventing deliberate replication.

KPI Category	Indicator	Definition	Target Benchmark	Review Cadence
LEADING (Day 14–30)	Numeric Distribution (ND)	% of target outlets with the pack on-shelf / in-cooler	≥60% in W1; ≥80% in W4	Weekly
LEADING	EPP Compliance Rate	% of audited outlets selling at or below EPP	≥85% in W2	Weekly (outlet audit)
LEADING	POSM Compliance Rate	% of outlets with correct POSM placed	≥80% in W2	Weekly (merchandising)
LEADING	Stockout Rate	% of target outlets out-of-stock on launch SKU	<5% at all times in W1–W4	Daily (pilot; weekly post-pilot)
MID-TERM (Day 30–90)	Trial Rate	% of target non-buyers who purchased the pack at least once in pilot period	≥15% of target non-buyer segment in pilot outlets	Monthly
MID-TERM	Cannibalization Rate	Volume transferred from existing packs as % of new pack volume	<30% (benchmark; adjust to market)	Monthly
MID-TERM	Repeat Purchase Rate	% of trial buyers who purchased again within 4 weeks	≥20% of trial buyers	Monthly
MID-TERM	Incremental Transactions	New transactions above pre-launch baseline in pilot outlets	≥target volume (from business case)	Monthly
LAGGING (6–18 months)	Penetration Uplift	Change in % of households purchasing the brand in pilot geography vs. control	Per business case target (typically +1–3pp in year 1)	Quarterly (panel data)
LAGGING	NSR per Case vs. Forecast	Actual NSR per case vs. business case assumption	Within ±5% of business case	Quarterly
LAGGING	System GP Impact	Incremental GP generated by the pack net of cannibalization and trade investment	Positive at Year 2; target per business case	Bi-annual
LAGGING	Pack Graduation Rate	% of recruitment pack buyers who subsequently purchased a higher-margin frequency or convenience pack	To be set market-specific; indicative ≥10% in Year 1	Annual

5.2 Incrementality Judgment Framework

The single hardest analytical challenge in recruitment pack measurement is distinguishing genuine incrementality from cannibalization and redistribution. This framework provides a structured approach.

Observed Pattern	Likely Interpretation	Recommended Action
New pack volume up; existing entry pack volume flat or up; total brand transactions up	Genuine recruitment: new consumers entering the brand. Ideal outcome.	Scale: expand distribution; protect EPP; monitor for mix dilution as volume grows
New pack volume up; existing entry pack volume down by similar magnitude; total transactions flat	Cannibalization: new pack replacing existing pack with no net consumer gain. High risk.	Fix: diagnose which consumer segment is switching (non-buyer or existing buyer). If primarily existing buyers, reconsider pack architecture.
New pack volume up; existing entry pack volume down; total transactions up moderately	Mixed: partial recruitment + partial cannibalization. Most common outcome.	Diagnose: quantify split. If incremental rate exceeds cannibalization threshold, continue and optimize. If not, Fix or Exit.
New pack volume up; higher-margin packs volume down; margin per case eroding	Mix dilution: pack is trading down existing consumers, not recruiting new ones.	Fix or Exit: critical signal. Investigate whether EPP positioning is too attractive relative to frequency packs. May require price adjustment or channel separation.
New pack volume below target; existing packs flat; no distribution gain	Execution failure: pack not reaching target consumer. Not a strategy failure yet.	Fix execution: diagnose against 5 non-negotiables. Address the specific gap.

5.3 Scale / Fix / Exit Decision Matrix

Decision	Trigger Conditions	Required Action	Timeline
SCALE	Volume ≥80% of business case target at 90 days; cannibalization within threshold; EPP compliance ≥85%; repeat purchase rate ≥20%; system GP positive or on track	Expand ND to Tier 2 outlets; increase production capacity; develop full national launch plan; schedule 6-month and 12-month milestone reviews	National rollout plan within 30 days of Scale decision
FIX	Volume 50–80% of target; one or two specific failure modes identified (e.g., EPP compliance or POSM compliance below threshold); cannibalization tracking in range	Identify the specific non-negotiable failure; develop targeted corrective action plan; re-run 30-day pilot in corrected configuration; re-evaluate at next cycle	30-day fix window; re-assessment within 60 days
EXIT	Volume <50% of target after Fix cycle has been attempted; OR cannibalization exceeds threshold and no corrective action available; OR system GP structurally negative at any reasonable volume projection	Orderly de-listing: customer communication plan; trade investment recovery; portfolio rebalancing; lessons learned documentation for Case Library (Ch.6)	Exit decision implemented within 30 days; portfolio review within 60 days

5.4 Pilot-to-Scale Optimization Loop

5.4 Pilot-to-Scale Optimization Loop

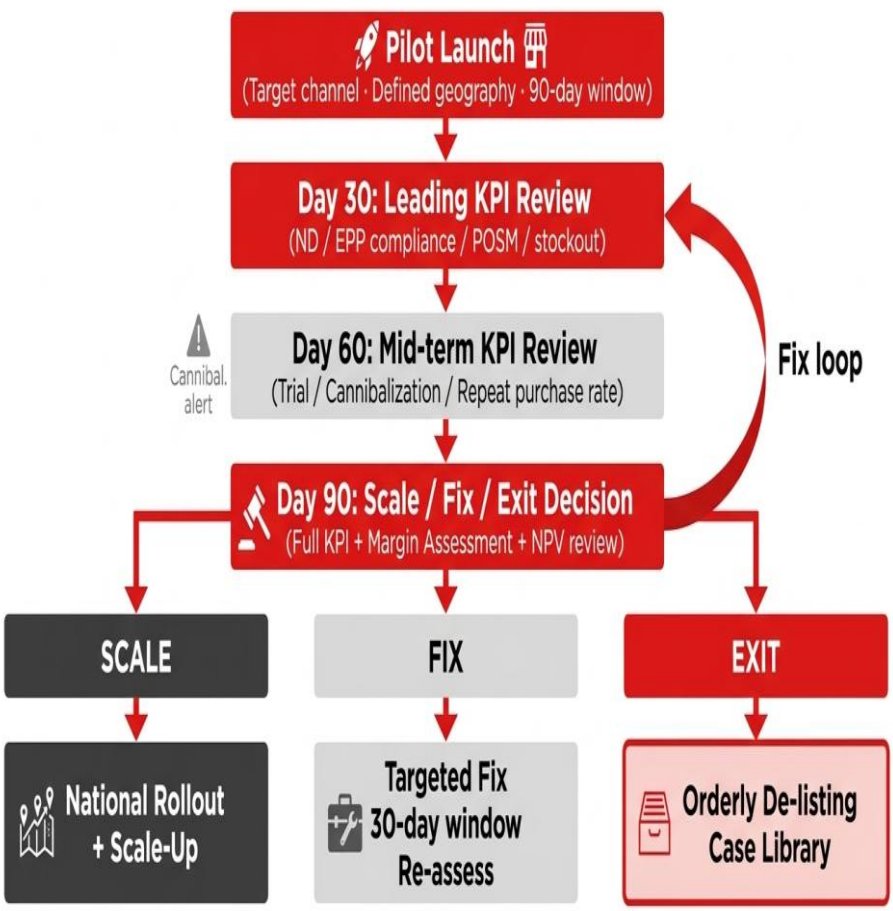

Figure 5.1 — Pilot-to-Scale Optimization Loop

5.5 KPI Governance and Reporting Cadence

Reporting Level	Frequency	Audience	Content
Outlet / Distributor	Weekly (pilot phase)	Sales Lead / Trade Marketing	ND, EPP compliance, POSM compliance, stockout rate, sell-through vs. target
Market RGM	Monthly	RGM Lead / Commercial Director	Full KPI dashboard: all leading + mid-term indicators; cannibalization first read; corrective actions if off-track
Senior Leadership	Quarterly	GM / VP Commercial / CFO	Volume vs. plan; NSR impact; GP contribution; Scale/Fix/Exit status; next-cycle plan
Regional / Global RGM	At milestone: 90-day and 12-month	Regional RGM / Global RGM CoE	Business case vs. actuals; incrementality assessment; lessons for Case Library; replication potential for other markets

5.6 Key Assumptions and Risk Flags

Key Assumption: The KPI architecture in this chapter assumes that outlet-level sell-out data is available for the pilot geography within 14 days of the sales event. In markets where distributor sell-in is the primary available data (common in Vietnam GT and Cambodia rural GT), trailing sell-in may be used as a proxy with a 10–15% adjustment

for inventory held at distributor level. This limitation must be disclosed in all performance reporting.

[FLAG: additional input required — Georgia (EMEA) and Turkey cases demonstrate that Affordability SKU List (ASL) tracking at the outlet level — monitoring numeric penetration, VPO, and CDE doors — provides an effective governance mechanism for affordability pack performance even without advanced panel data. This model should be reviewed for applicability in Cambodia and Vietnam GT contexts.]

Chapter 6 Case Library

6.1 Case Library Index

Case	Market	Pack Type	Primary Chapter Linkage	Market Context
Case 1	Taiwan	Recruitment — Mini CAN 200ml CVS Entry Pack	Ch.2, Ch.3, Ch.4	Developed; MT-dominant; CVS recruitment battleground
Case 2	Vietnam	Recruitment — RGB Entry Pack Project	Ch.2, Ch.3	Emerging; GT-dominant; high-volume traditional trade
Case 3	India (INSWA)	Affordability — 1L PET Home Pack	Ch.2, Ch.3, Ch.4, Ch.5	Large emerging; high inflation; grocery-driven at-home
Case 4	Spain / Europe	Affordability — System-wide EPP intervention	Ch.1, Ch.4, Ch.7	Developed; MT-dominant; high inflation affordability pressure
Case 5	Pakistan	Recruitment + Affordability — RGB + 1L PET	Ch.2, Ch.3, Ch.4, Ch.5	Emerging; hyperinflationary; GT + MT dual strategy
Case 6	Singapore	Recruitment — Coke No Sugar 250ml PET Entry Pack	Ch.2, Ch.3, Ch.4	Developed; CVS-dominant; no-sugar recruitment
Case 7	Cambodia	Recruitment — 580ml Coca-Cola PET Launch	Ch.3, Ch.4	Frontier emerging; GT + MT; KHR price point entry
Case 8	Georgia (EMEA)	Affordability — Strategic Affordability SKU List	Ch.2, Ch.5, Ch.7	Emerging; competitive; no price increase strategy

6.2 Transferability Assessment Matrix

Case	Transferable to Developed Markets?	Transferable to Emerging/GT Markets?	Key Transfer Condition
Case 1 — Taiwan Mini CAN	High — CVS channel and young consumer dynamics widely applicable	Medium — requires cold CVS infrastructure	Chilled CVS channel present; young consumer segment data available
Case 2 — Vietnam RGB	Low — RGB economics require specific RTM and refillable infrastructure	High — GT markets with RGB history and SC capability	RGB supply chain readiness; consumer RGB familiarity in target channels
Case 3 — India 1L PET	Medium — at-home value pack logic transfers; magic price point varies	High — most relevant in large, grocery-heavy emerging markets	Grocery channel dominant in target; 1L pack economics close in local cost context
Case 4 — Spain Affordability	High — system-wide EPP intervention and cross-functional speed model directly transferable	High — pace and cross-functional model transfers regardless of market type	C-suite mandate and cross-functional ownership from Day 1
Case 5 — Pakistan RGB + 1L	Low — hyperinflation context is market-specific; specific pack choices vary	High — dual-pack strategy (IC + FC entry) transfers to similar emerging markets	DDI and inflation benchmarks recalibrated locally; dual-pack portfolio architecture feasible
Case 6 — Singapore NS PET	High — no-sugar recruitment strategy increasingly applicable in	Medium — requires established no-sugar category awareness	No-sugar brand penetration sufficient to support dedicated entry pack

Case	Transferable to Developed Markets?	Transferable to Emerging/GT Markets?	Key Transfer Condition
	health-conscious markets		
Case 7 — Cambodia 580ml	Low — KHR price mechanics market-specific	High — small emerging market pack launch mechanics transfer	KHR 1,000–1,500 price point context; MIT mechanics adaptable to similar frontier markets
Case 8 — Georgia ASL	High — ASL governance model transfers to any market needing affordable SKU list management	High — ASL approach particularly relevant in price-sensitive, inflation-volatile markets	RGM team capability to manage SKU-level pricing governance; ASL tracking infrastructure

6.3 Case 1 — Taiwan: Mini CAN 200ml CVS Recruitment Pack

Case 1: Taiwan — Mini CAN CVS Recruitment
Market: Taiwan | Pack Type: Recruitment Pack — Single Serve Impulse

Field 1: Market Context	Taiwan is a mature, MT/CVS-dominant NARTD market. SSD category share of NARTD has remained broadly flat at 9.1–9.8% from 2020–2024. Category penetration among consumers under 35 is stalling, with sweetened tea over-indexing in the youth segment. CVS (7-Eleven, FamilyMart) is the primary recruitment battleground for on-the-go and away-from-home occasions among the 15–29 age group. 55% of ambient sweetened tea in CVS sells at or below NT$20.
Field 2: Business Problem	SSD penetration stagnant, especially among consumers under 35. Growth opportunities identified in Work/School, On-the-go, and Away-from-Home Meal occasions. Existing entry pack (Sleek CAN 330ml) priced above the NT$20 CVS Magic Price Point, with average price high relative to tea alternatives. No pack positioned to effectively recruit young, light SSD buyers in the CVS channel.
Field 3: Why This Pack Type	Mini CAN 200ml was selected as a portion-right, price-right entry format for the CVS channel: (a) smallest viable IC serve matching typical light buyer consumption on-the-go; (b) deliverable at NT$13.5–16 average price — at or below the NT$20 CVS Magic Price Point; (c) conjoint research confirmed 200ml as the perceived ideal portion for non-buyers (avg. ideal 275ml; 200ml clears the purchase threshold at target price). Three-phase evolution designed: Phase 1 (Q4 2025) Mini CAN 200ml as quick-win; Phase 2 (Q2 2026) PET 300ml as ideal on-the-go portion replacement.
Field 4: Analysis and Tools Used	Consumer conjoint study (15–29 y.o. non-/light SSD buyers): validated Mini CAN 200ml as preferred format at NT$13.5 average price with value share uplift vs. baseline. Price elasticity modelling: confirmed NT$13 price delivers +0.08pp value share uplift in Total buyer base and +0.02pp specifically among 15–29 target segment. P&L simulation: Swire GDC and customer margin modelled at NT$15 RSP. 2024 FY Mini CAN penetration already at 5.3% (+1.7pp), confirming existing demand signal.
Field 5: Final Pack Solution	200ml Mini CAN (Sleek format) at NT$15–16 RSP (NT$13.5 average CVS price including promotions). Positioned as the lowest entry price in the SSD CVS portfolio. Phase 2: PET 300ml at NT$22 RSP (NT$18 average) for food-pairing and on-the-go occasions — confirmed as ideal portion for food pairing by target consumers (avg. 298ml for food-pairing fit).
Field 6: Execution Approach	CVS-first distribution strategy with 7-Eleven as lead customer. Cold placement (CVS chilled bay) is non-negotiable — not ambient. POSM: in-cooler shelf strips and till-point communication. Incentive mechanic: introductory trade offer to secure facing. 3-phase portfolio evolution communicated to trade to build confidence in roadmap — not a one-off promotion. Sales force trained on Mini CAN occasion narrative (snack/leisure, portion

	control, youth).
Field 7: Results	Phase 1 (to Q4 2025): Mini CAN 200ml penetration reached 5.3% of CVS buyers within existing markets, with +1.7pp growth vs. prior period. Proposal targets NT$16 RSP as formal entry point to drive best value share and transaction uplift in 15–29 segment. Full national rollout results pending Phase 2 completion (Q2 2026). [FLAG: Post-launch full performance data not available in source materials reviewed; market RGM team to update Case Library with 6-month results.]
Field 8: Key Learnings	(1) EPP design must start from the competitive environment in the specific channel — 55% of ambient tea in CVS below NT$20 is the operative benchmark, not the general SSD price ladder. (2) Phase-based portfolio evolution (Interim → Quick Win → Ideal) gives the trade confidence and avoids the perception of a one-off tactical promotion. (3) Conjoint research to validate portion size is essential — "small pack" is not a sufficient brief; the ml must be consumer-validated.
Field 9: Transferability	High transferability to: (a) other markets with active CVS/convenience channels targeting young consumers (Thailand CVS, Hong Kong CVS, Singapore); (b) markets where ambient beverages compete at price parity with SSD in convenience channels. Key transfer condition: chilled CVS distribution infrastructure and consumer conjoint data for portion and price validation.

6.4 Case 2 — Vietnam: RGB Entry Pack Strategic Assessment

Case 2: Vietnam — RGB Affordable Entry Pack
Market: Vietnam | Pack Type: Recruitment Pack — Returnable Glass Bottle

Field 1: Market Context	Vietnam is a high-volume, GT-dominated emerging market. Daily Disposable Income approximately VND 160,000–180,000 (2025). The OBPPC current portfolio has a structural gap at 3–4% DDI — approximately VND 5,000–7,500 — where the market has no affordable IC entry pack below the 235ml CAN (VND 8,000–9,000) or 300ml PET (VND 6,000). DDI benchmark indicates the VND 5,000–7,000 range is the operative entry zone for low-income GT consumers. Per capita is targeted to grow to regional benchmarks; current recruitment coverage does not reach the full pricing spectrum.
Field 2: Business Problem	Recruitment is not covering the full pricing spectrum: VND 5,000–6,000 price point represents a genuine white space. PET 300ml at VND 6,000 is the cheapest current option in GT grocery, but with short shelf life, rural distribution limitations, and pack impression challenges. The market needs an affordable entry pack that can reach rural GT, deliver at or below VND 7,000, and be economically viable at the bottler level.
Field 3: Why This Pack Type	RGB (Returnable Glass Bottle) was assessed as the primary candidate because: (a) lower production cost per unit vs. new PET mold capex; (b) longer shelf life than PET — critical for rural GT distribution; (c) established consumer familiarity with RGB in Vietnam GT and E&D; (d) sustainability alignment (25% refillable bottle target by 2030); and (e) global case studies (Pakistan, India) demonstrate RGB profitability at scale in GT channels. ASSP PET (250ml) was assessed as an alternative: lower complexity but requires ASSP production technology and has short shelf life concerns for rural GT.
Field 4: Analysis and Tools Used	OBPPC current state mapping across all channels (Grocery, MT, E&D) with GP margins and index data. Volume conjoint simulation (Year 1): PET 250ml = 1.6–3.2 MMUC; PET 200ml = 1.7–3.6 MMUC; CAN 180ml = 2.0–4.2 MMUC. Value chain simulation across 5-year horizon (Bottler Assumptions + KO Assumptions). Cannibalization modelling: PET 250/200 cannibalize PET 300 (100% replacement assumption); CAN 180 cannibalize CAN 235. Project team: cross-OU (SCC, CCBV, OU) with Finance, Marketing, SC, and Commercial workstreams.

Field 5: Final Pack Solution	Final pack recommendation not confirmed as of mid-2023 source materials — multiple options under evaluation: 200ml RGB at VND 7,000–8,000; 250ml PET at VND 5,000 (ASSP technology required); 200ml PET at VND 5,000 (ASSP technology required). Supply chain readiness assessment and VC simulation to determine final recommendation. [FLAG: Final pack selection and launch outcome not available in source materials reviewed. Vietnam RGM team to update Case Library with final recommendation and results.]
Field 6: Execution Approach	Pilot proposed in urban and rural GT channels across North, Central, and South Vietnam. Supply chain complexity — production line configuration, bottle washer, glass seeding, crate logistics — requires phased SC build-out. Consumer habit rebuilding required for RGB (if RGB selected): trade education on handling and returns; consumer communication on refresh and value.
Field 7: Results	Project initiated April 2023. Final volume projection at project initiation: Y1 ~1.7 MMUC (starting point), Y5 targeting 16% of total entry pack volume (India benchmark). [FLAG: Post-2023 progress and launch results not confirmed in reviewed source materials. Vietnam RGM team to provide update.]
Field 8: Key Learnings	(1) RGB assessment requires a dedicated SC workstream — the commercial case cannot be evaluated independently of the production, logistics, and crate investment requirements. (2) Volume projections for a new pack type with channel overlap (PET and RGB in same channel) require explicit cannibalization modelling: what replaces what, in what timeframe. (3) DDI benchmark alignment between OU and bottler is critical to lock before the VC simulation — different DDI assumptions produce materially different volume projections.
Field 9: Transferability	RGB entry pack strategy is transferable to other emerging GT markets where: (a) RGB supply chain infrastructure exists or is investable; (b) consumer familiarity with RGB is present; (c) DDI benchmark indicates PET entry price is above affordable range. Relevant markets: Cambodia (GT), Bangladesh (GT), Sub-Saharan Africa. Not directly transferable to CVS or MT dominant markets without format adaptation.

6.5 Case 3 — India (INSWA): 1L PET Affordable Home Entry Pack

Case 3: India (INSWA) — 1L PET Home Affordability Pack
Market: India | Pack Type: Affordability Pack — At-Home Entry Pack

Field 1: Market Context	India is a large, grocery-dominated emerging market with at-home NARTD occasions 4x larger than AFH. Coca-Cola at-home share is approximately half of AFH share. KO overall household penetration had stalled at 20–26% (2018–2020). The lead entry home pack prior to this initiative was Sparkling 1.25L at INR 65 — representing 19% of Daily Disposable Income, which the RGM analysis confirmed was blocking home penetration expansion. Grocery represents 67% of FMCG universe; KO penetration in grocery was approximately 22% at pack level in 2019.
Field 2: Business Problem	At-home occasion volume is the largest untapped growth pool. KO household penetration stagnant. Existing entry home pack (1.25L at INR 65) priced above the affordability threshold for the mass grocery consumer. Distribution limited by price — only 33% ND for the 1.25L pack. Result: a large addressable consumer pool excluded by price.
Field 3: Why This Pack Type	1L PET at INR 50 was selected because: (a) INR 50 is the magic price point in FMCG for transactions above INR 40 (highest transaction density); (b) 1L = 4 x 250ml serves — ideal for average Indian household of 4; (c) downsizing from 1.25L with a price maintained at INR 50 created a consumer-perceived value gain vs. competitive 1.25L at same price; (d) one universal mold for all SSD brands allowed fast capex execution with no per-brand

	tooling; (e) conjoint and NSR 2.0 analysis confirmed ~40% transaction uplift in the home segment.
Field 4: Analysis and Tools Used	Consumer conjoint + RGM 2.0 analysis (transaction uplift modelling). Household panel: HH penetration tracking (Kantar). Nielsen RMS: market share and distribution tracking. Financial modelling: preform weight optimization (37g → 33g → 29.8g) to improve system economics at scale while maintaining INR 50 consumer price. Value chain analysis: matching profitability of 1.25L at INR 65 with scale-driven bottom line improvement.
Field 5: Final Pack Solution	1L PET Sparkling at INR 50 magic price point. One universal mold across SSD brands (reduced capex, faster execution). Case of 15 bottles (vs. 12 for 1.25L) to maintain case volume. Priority launch: North and East India (35% of NARTD market). Channel strategy: 1L at INR 50 leads in Traditional Trade (88% of business); 1.25L at INR 65 maintained in Modern Trade with consumer promo mechanics.
Field 6: Execution Approach	Distribution approach: penetrate home pack within existing KO outlets AND use the pack as the lead vehicle for expanding KO FMCG footprint into new grocery outlets. Focus markets Phase 1: North/East India. Network: 200,000 net new KO outlets added YTD as part of horizontal expansion program led by 1L. Shopper communication: drinking moments, marketing activation.
Field 7: Results	Volume: 2x growth in Entry Home Segment vs. overall KO CSP growth in focus markets. Market share: +1.6pp vs. YTD Sep 2019 in pack segment — achieved despite competitor promotional response (1.25L price-dropped to INR 50). Household penetration: 3x increase in Entry Home segment in Priority Launch markets vs. rest of India. Distribution: 45% ND achieved for pack segment (+4pp). 200,000 net new KO outlets added via 1L-led horizontal expansion.
Field 8: Key Learnings	(1) Downsizing with a maintained magic price point can outperform a simple price cut — the 1L at INR 50 was more successful than the 1.25L at INR 50 (competitive response), demonstrating that the right-size-at-right-price creates stronger consumer value perception. (2) One universal mold across all SSD brands is a critical operational insight: allows fast execution, minimizes capex, and enables portfolio-wide entry-price point architecture with a single production investment. (3) Distribution expansion and affordability are linked: the 1L was the vector for entering 200,000 new outlets that the 1.25L at INR 65 could not reach.
Field 9: Transferability	High transferability to any large emerging market with: (a) at-home occasion dominance; (b) stagnant HH penetration due to above-DDI entry home pack pricing; (c) magic price point at or near the INR 50 equivalent in local currency; (d) universal mold economics feasible in local production context. Directly applicable to: Vietnam (future AT-home pack development), Cambodia (if AT-home occasion grows), Bangladesh.

6.6 Case 4 — Spain / Europe: System-Wide Affordability Intervention

Case 4: Spain / Europe — Affordability Speed-to-Market
Market: Spain / Europe | Pack Type: Affordability Pack — System-Wide EPP Intervention

Field 1: Market Context	Spain is a developed, MT-dominant market in a high-inflation environment (2024–2025). The European system had developed a dual affordability-premiumization strategy: protecting heavy buyers with upsized value packs while recruiting medium and light buyers with single-serve and mini formats. The affordability pillar focused on four elements: Right Pack, Right Price & Promo, Right Activation Tools, and Right Display Principles — a simplified framework for consistent market execution across bottler territories.

Field 2: Business Problem	Consumer affordability pressure in Spain resulting from sustained food and beverage inflation. Risk of transaction loss as consumers traded down to private label or cheaper alternatives. Challenge: typical RGM pack and pricing planning cycles (6–12 months) were too slow to respond to rapidly deteriorating consumer affordability. The system needed to demonstrate that it could execute an affordability response at commercial speed.
Field 3: Why This Pack Type	The response was not a single new pack — it was a system-wide repricing and pack-architecture reaffirmation: ensuring the right packs were at the right price in the right channels simultaneously. This included activating existing "duals" mechanics (retailer-exclusive pricing and bundle mechanics), reinforcing single-serve entry formats, and communicating value clearly in-store. The decision was made not to create new pack formats but to optimize the execution of the existing portfolio at EPP-aligned prices.
Field 4: Analysis and Tools Used	Shopper-centric heavy-medium-light (HML) consumer segmentation. Consumer pricing sensitivity research: light buyers driven by absolute entry price; heavy buyers drive by PPL vs. competitive alternatives. Marketing Mix Modelling (B-MAT framework) to identify optimal investment allocation across activation levers. Bottler alignment workshop to pre-align priorities before formal planning cycle.
Field 5: Final Pack Solution	System-wide affordability activation across the existing Spain portfolio, with EPP-anchored pricing enforced at outlet level. Key elements: (a) "Duals" strategy — large multipack format at value PPL for heavy buyers (protect volume); (b) single-serve ice-cold entry pack at EPP for light/medium buyer recruitment; (c) retailer-specific promotional mechanics negotiated to land right-price-right-pack in each channel. No new pack format required — execution of existing portfolio at correct price architecture.
Field 6: Execution Approach	Plan aligned October; launched January 2nd — 10-week planning and execution window. Success factors cited: (1) treated as the #1 commercial priority for the entire system (RGM, Marketing, Legal, Finance, Supply Chain, Bottler) from Day 1; (2) "progress over perfection" — launched with available materials, added new elements incrementally; (3) deep cross-functional collaboration allowed rapid decision-making; (4) bottler briefed and aligned before formal planning cycle opened.
Field 7: Results	Full quantitative results from Spain affordability intervention are not available in source materials reviewed. The case was cited in the RGMX @ Scale session (October 2025) as a reference model for commercial speed and cross-functional execution. [FLAG: RGM CoE Europe to provide quantified outcomes (NSR, volume, share, consumer metrics) for inclusion in next Playbook version.]
Field 8: Key Learnings	(1) Speed is a strategic capability: a 10-week plan-to-launch cycle in a developed market is achievable when the system makes it the #1 priority — not a side project. (2) Cross-functional ownership from Day 1 (not sequential sign-off) is the single most important governance change. Every function that can create a delay must be in the room from the start. (3) Progress over perfection: launching with 80% of the ideal execution plan and adding the remaining 20% in weeks 2–4 is superior to waiting for 100% readiness.
Field 9: Transferability	Very high. The commercial speed model and cross-functional ownership structure are directly transferable to any market facing a rapidly deteriorating affordability environment. The "Affordability Look of Success" framework (Right Pack / Right Price & Promo / Right Activation Tools / Right Display Principles) is a universal operating standard applicable across all SCC markets.

6.7 Case 5 — Pakistan: RGB and 1L PET Dual Recruitment Strategy

Case 5: Pakistan — RGB + 1L PET Dual Recruitment
Market: Pakistan | Pack Type: Recruitment + Affordability — Dual Entry Pack Strategy

Field 1: Market Context	Pakistan is an emerging market with the lowest consumer affordability among the Coca-Cola system's key benchmarked markets. Operating in a hyperinflationary environment (2022–2024): tea cup price rose PKR 30 → 50; bus ticket PKR 30 → 40; snacks PKR 25 → 40 — all reference price points for calibrating NARTD Magic Price Point. IC (immediate consumption) Entry Price Point targeted at PKR 30–50; FC (future consumption) maintained at Magic Price Point of PKR 100. Portfolio: RGB 250ml and 1L PET as dual recruitment anchors — both immediate and future consumption occasions.
Field 2: Business Problem	High inflation compressing consumer wallets and raising the risk of transaction loss at existing price points. IC entry price point drifting above affordability threshold for price-sensitive GT consumers. Risk of permanent exit by light buyers if not addressed. Simultaneous challenge: maintaining system profitability while offering accessible price points.
Field 3: Why This Pack Type	Dual-pack strategy rationale: (a) RGB 250ml = IC (immediate consumption) affordable entry at GT level, with strong brand presence and visibility; (b) 1L PET = FC (future consumption) at PKR 100 magic price point — at-home occasion and value buying. RGB: established consumer familiarity in Pakistan GT; refillable economics support margin at scale. 1L PET: ideal home pack for 4-person household (250ml serves × 4); PKR 100 maintained as magic price point while competitors were also adjusting upward.
Field 4: Analysis and Tools Used	Pricing Trinity model for RGB communication strategy. OBPPC workshop: system alignment on pack architecture, portfolio opportunities, and white spaces. Consumer focus groups with distributor engagement. KPI cascade: volume, numeric distribution, weighted distribution, transactions vs. LY. Asset investment analysis: 1M UC glass injection, 45,000 cooler doors, incremental customer margin investment on 1L and RGB.
Field 5: Final Pack Solution	IC: RGB 250ml — held IC entry price below food inflation index; glamorized brand experience through in-store communication and intrinsic pack assets. FC: 1L PET at PKR 100 magic price point — 2% reduction in price index vs. frequency packs, signaling value commitment. Case configuration maintained to ensure distributor handling economics viable.
Field 6: Execution Approach	Four pillars: (1) Pricing Excellence — Trinity-based RGB communication; IC entry below food inflation; FC magic price point. (2) Execution Excellence — volume and numeric KPIs with progressive slabs, rewards and recognition for distributors. (3) Consumer Focus — OBPPC workshop alignment; portfolio white space communication. (4) Collaborate Inside, Compete Outside — strong bottler-system joint planning. 50,000 outlet customer engagement program for RGB and 1L. Asset investment: +1M UC glass injection; +45,000 cooler doors.
Field 7: Results	Volume: +38% vs. LY overall volume and transactions. 1L PET: +40% vs. LY volume; +2% mix improvement. RGB: +147% vs. LY volume; sustained positive growth. Distribution: +20,000 outlets vs. LY. 1L ND: 70% vs. 61% LY; RGB ND: 48% vs. 41% LY. Value: +13% vs. LY. Share: maintained or gained vs. competition despite competitive promotional pressure. System profitability: steady margins maintained — evidencing that affordability and profitability are not mutually exclusive.
Field 8: Key Learnings	(1) IC and FC entry packs serve different consumer missions and must be managed with separate strategies — one price point does not address both occasions. (2) Asset investment (cooler doors + glass seeding) is often the binding constraint for RGB scale-up: the business case must include asset economics, not just pack-level economics. (3) The most powerful signal to the trade in a hyperinflationary environment is holding the FC magic price point while all other reference prices are rising — it creates a disproportionate brand salience effect at the point of purchase.
Field 9: Transferability	High transferability to: other high-inflation GT markets (Bangladesh, Sri Lanka, Sub-Saharan Africa). Dual IC/FC entry pack architecture (RGB + large PET) is particularly transferable. Key conditions: RGB SC infrastructure available; magic price point identified and defended; trade incentive mechanics feasible in distributor model.

6.8 Case 6 — Georgia (EMEA): Strategic Affordability SKU List

Case 6: Georgia (EMEA) — Affordability SKU List Governance
Market: Georgia | Pack Type: Affordability — Governance and Execution Model

Field 1: Market Context	Georgia is a small, competitive NARTD market with 3.7M population (declining from 5.4M in 1991). TCCS FY2023 SSD share: 61% (+4pp). IC mix at 42% (well above CCAR region average of 23%). Per cap in 2022 at 247 — highest in CCAR. Key competitive threats: local affordable FSSD brands with Soviet-era brand heritage; Pepsi and fragmented competitors. Inflation low by regional standards; competitive pressure the primary affordability driver rather than consumer income compression.
Field 2: Business Problem	Intense competition from local affordable brands with deep consumer loyalty and price advantage. TCCS faces challenge of maintaining affordability perception while growing at-home and at-venue volume. At-home volume constrained by lack of clearly defined affordable SKU list with consistent execution across Traditional Trade and Modern Trade.
Field 3: Why This Pack Type	Strategic decision: no price increase for the full portfolio in 2023 — focus on economy of scale and affordability governance. Key innovation was the Affordable SKU List (ASL): a defined set of entry and upsize packs (250ml, 1L for entry; 500ml, 2L for upsize) with committed pricing at the "create value for consumers" threshold. Not a new pack — a governance innovation that gave the sales force clear execution priorities and the trade a credible "no price increase" message.
Field 4: Analysis and Tools Used	Affordability SKU List development: selection of entry (250ml, 1L) and upsize (500ml, 2L) pack formats anchored to affordable price points. Competitive pricing analysis: water positioned strategically below market leader. PICOS development for ASL in-store execution. Pay-for-Performance incentive for TT and MT: two KPIs — availability (ASL penetration) and visibility (CDE per outlet and VPO).
Field 5: Final Pack Solution	Affordable SKU List: 250ml (IC entry) + 1L (FC entry) + 500ml (IC upsize) + 2L (FC upsize). Water innovation: positioned below Borjomi market leader to attract price-sensitive consumers and drive category growth. Channel differentiation: TT = PET; MT = PET and Glass; Horeca = Glass. New SKUs: 1L Sprite and 1L Fanta Tropic to broaden affordable multi-flavor footprint.
Field 6: Execution Approach	Sales force clarity: two metrics only — ASL availability (penetration of AFL) and visibility (CDE per outlet). Pay-for-Performance in both TT and MT aligned to these two KPIs. In-store: SOVI and SOCVI in-store exclusivity exchanges for outdoor branding. CDE investment: water-dedicated CDE doors to drive visible affordability signal at cold shelf.
Field 7: Results	ASL Numeric Penetration (TT+MT): 70% (+4pp vs. PY) → 76% (+8pp vs. PY). ASL VPO Volume vs. PY: +23% (TT+MT) → +64%. ASL Mix Volume (TT+MT): 65% (+2pp vs. PY). CDE Doors/Outlet vs. PY: +31%. Water Mix Volume: 9% (+2pp vs. PY). 1L Pack Volume Mix in SSD: 10% (+2pp vs. PY). FY2023 TCCS SSD share: 61% (+4pp).
Field 8: Key Learnings	(1) Affordability governance — defining an Affordable SKU List with two clear KPIs — is often more powerful than launching new packs. Clear priorities and a simple measurement framework outperformed complex trade programs in this market. (2) "No price increase" as a strategic commitment in a low-inflation environment is a powerful competitive tool — particularly against local competitors with heritage price positioning. (3) Channel-differentiated pack format (PET for TT, Glass for Horeca) allows affordability in volume channels while protecting brand equity in prestige channels.
Field 9: Transferability	High. The ASL governance model — define a small set of affordable packs, set two KPIs, pay-for-performance against those KPIs — is directly transferable to any market where the primary challenge is execution consistency rather than pack innovation. Particularly

	relevant for: Cambodia (consistent GT execution), Vietnam (off-invoice spend governance), Thailand (ASL for GT channel).

6.9 Case 7 — Cambodia: 580ml Coca-Cola Recruitment Pack Launch

Case 7: Cambodia — 580ml Coca-Cola PET GT + MT Entry Pack
Market: Cambodia | Pack Type: Recruitment — Frontier Emerging Market Entry Pack

Field 1: Market Context	Cambodia is a small frontier emerging market (population ~17M) with rapid urbanisation and growing modern trade penetration in Phnom Penh and provincial cities. GDP per capita ~USD 1,800 (2024). SSD category is price-sensitive and channel-fragmented: General Trade (GT) represents the dominant volume channel; Modern Trade (MT) is growing rapidly in Phnom Penh and Siem Reap. Key competitive dynamics: local fruit drink and water brands compete at KHR 500–800 price points; SSD entry price must be anchored below KHR 1,500 to remain accessible to the core rural and peri-urban consumer segment. Coca-Cola holds category leadership but penetration headroom is significant among rural households purchasing below monthly.
Field 2: Business Problem	Core Coca-Cola volume in Cambodia was concentrated in the 1.5L PET (at-home) and 330ml Can (MT/impulse) formats — neither accessible at the KHR 1,000–1,500 magic price point that represents the primary single-serve entry threshold in GT. This left a gap in the price-pack ladder: no Coca-Cola format was priced competitively enough for everyday single-serve consumption by rural consumers trading on daily cash income. The result: trial rates in rural GT remained low and category penetration among lower-income segments was stagnant.
Field 3: Why This Pack Type	The 580ml PET format was selected to address the rural GT single-serve occasion at the KHR 1,500 RSP. Analysis of the price-pack ladder confirmed that: (a) 1.5L PET was too large for single-serve and priced above the daily cash threshold; (b) 330ml Can was priced at KHR 2,000–2,500 in GT, above affordability ceiling; (c) the 580ml format, sized for one or two consumers at point of purchase, could be priced at KHR 1,500 MT and KHR 1,500 key GT — within the critical affordability window. Format size also aligned with the observed consumer behaviour of sharing a cold beverage between two people in rural GT settings.
Field 4: Analysis and Tools Used	Price-pack ladder analysis: existing portfolio mapped against KHR 500–2,500 price band by channel; gap identified at KHR 1,000–1,500. DDI affordability check: KHR 1,500 represents approximately 2.5–3.5% of estimated daily household income for target segment — within the 3–6% DDI benchmark. Competitive benchmark: local fruit drinks at KHR 500–800; water at KHR 500–600; 580ml Coca-Cola at KHR 1,500 positions as accessible premium. Volume projection: Year 1 target volume set from channel-by-channel ND rollout plan across Phnom Penh MT and provincial GT. [FLAG: GT numeric distribution target not confirmed in source documentation; market RGM to validate before launch declaration.]
Field 5: Final Pack Solution	580ml Coca-Cola PET at KHR 1,500 RSP (MT and key GT). Launch scope: Phnom Penh MT — all key accounts; Provincial GT — tier 1 outlets in Phnom Penh, Siem Reap, and Battambang in Phase 1. Pack variant: Coca-Cola Original only in Phase 1 (brand clarity priority). Packaging: standard PET, POSM adapted to KHR 1,500 price communication in Khmer. Sales motivation mechanic: volume-linked distributor incentive active from Day 1. Consumer activation: cold consumption emphasis; in-store sampling at MT where feasible.
Field 6: Execution Approach	Pre-launch: all distributors briefed in October 2025; sales force trained on EPP messaging and KHR 1,500 RSP enforcement. POSM deployed to all target outlets pre-launch. MT: confirmed KHR 1,500 RSP shelf price; dedicated shelf space and cooler facing for 580ml.

	GT: KHR 1,500 RSP negotiated with key outlet owners in target towns; visual price tags deployed. Sales motivation: tiered volume bonus for distributors and sales representatives based on 580ml sell-out in pilot period. KPI tracking: weekly sell-in by distributor, bi-weekly outlet audit in pilot geography.
Field 7: Results	[DATA PENDING — October 2025 launch; 90-day results not yet available in source materials reviewed.] Confirmed pre-launch indicators: POSM deployed in all target outlets; distributor briefing completed; KHR 1,500 RSP confirmed in MT. Sales motivation mechanics activated. Volume vs. Year 1 target to be assessed at 90-day review. [FLAG: 90-day KPI review due January 2026; results to be added to Case Library upon receipt from Cambodia RGM team.]
Field 8: Key Learnings	(Pre-result learnings from launch design) (1) In frontier emerging markets, the price-pack ladder gap at the daily cash threshold (KHR 1,000–1,500 in Cambodia) is the single most important affordability failure point — not brand equity or channel execution. Solving the price-pack gap is the priority intervention. (2) The 580ml format successfully threads between "too small to be good value" (can formats) and "too large for daily cash purchase" (1.5L PET). Portion-right sizing for the two-person sharing occasion is a replicable principle. (3) Clear KHR price communication at the outlet level — price tags, POSM, distributor briefing — is essential in markets where consumers are accustomed to price negotiation at GT. Price ambiguity at GT level destroys the recruitment function of an entry pack.
Field 9: Transferability	Medium-High. The core principle — fill the price-pack ladder gap at the local daily cash threshold with a share-size PET format — is directly transferable to: Bangladesh (BDT 20–30 threshold; similar GT structure); Vietnam rural GT (VND 10,000–15,000 threshold; multi-person sharing occasion); Laos and Myanmar (similar frontier emerging market profiles); Sub-Saharan Africa (small-format PET at local magic price point in GT). Key transfer conditions: (a) GT-dominant RTM with distributor model; (b) identified daily cash threshold below existing portfolio entry price; (c) share-size consumption occasion in the target consumer segment.

6.10 Case 8 — Singapore: No Sugar Entry Pack Recruitment

Case 8: Singapore — Coca-Cola No Sugar 250ml PET CVS Entry Pack
Market: Singapore | Pack Type: Recruitment — No-Sugar Category Entry, CVS-Dominant

Field 1: Market Context	Singapore is a highly developed, CVS-dominant market (population ~6M; GDP per capita ~USD 88,000). The NARTD SSD category is mature: overall penetration is high, but volume growth has been flat-to-declining on Original Sugar variants due to government-led sugar reduction initiatives (Healthier Choice Programme; Nutri-Grade labelling effective 2023). Nutri-Grade legislation requires SSDs with >8g sugar per 100ml to display a "D" grade — the lowest — at point of sale in all channels. Coca-Cola Original at Nutri-Grade D faces a display disadvantage vs. no-sugar alternatives and healthier beverages at CVS checkout. No-Sugar SSD sub-category is growing at high single digits. Key consumer opportunity: younger consumers (18–35) who are willing to consider SSD but default to water or RTD tea due to sugar concern — a clear recruitment gap for No-Sugar Coca-Cola.
Field 2: Business Problem	Coca-Cola No Sugar existed in the Singapore portfolio in the 330ml can and 1.5L PET formats, but neither format was optimised for the CVS trial occasion. The 330ml can was priced at SGD 1.90–2.20 in CVS — above the entry price threshold for a consumer trialing no-sugar Coca-Cola for the first time (where expectations are benchmarked against water and RTD tea at SGD 1.20–1.60). The 1.5L was an at-home format with no relevance to the CVS impulse occasion. Penetration of No-Sugar among the 18–35 target segment was significantly below total SSD penetration — the format and price were not driving

	trial.
Field 3: Why This Pack Type	A 250ml PET format was identified as the optimal entry vehicle for the CVS single-serve occasion: (a) 250ml is portion-right for a single ice-cold consumption — not over-sized like 330ml for a consumer uncertain about the flavour of a no-sugar variant; (b) PET enables a lower RSP than can (production cost advantage at small volume); (c) at SGD 1.20–1.30 RSP in CVS, the 250ml PET sits within the RTD tea price band — directly competitive with the primary beverage alternative for the target segment; (d) the smaller size minimises consumer risk ("if I do not like it, I have only spent SGD 1.20"). [ILLUSTRATIVE CASE — volume and price figures are indicative based on source material principles; specific confirmed data not available in materials reviewed.]
Field 4: Analysis and Tools Used	Price-pack ladder analysis: 250ml PET at SGD 1.20–1.30 mapped against RTD tea (SGD 1.20–1.60), water (SGD 0.80–1.20), and 330ml Can Coca-Cola NS (SGD 1.90–2.20). Consumer conjoint study (illustrative): target attribute weighting — Sugar Free status (primary), Price ≤SGD 1.50 (secondary), Portion Size ≤300ml (tertiary). Cannibalization modelling: primary risk from 330ml Can No-Sugar cannibalisation; modelled at 25–35% acceptable threshold. 6-Dimension Evaluation Scorecard: Consumer Fit (5/5), Occasion Fit (5/5), Channel Fit (5/5 — CVS cold infrastructure confirmed), Brand Fit (4/5 — No-Sugar equity aligned with Healthier Choice positioning), Economic Fit (3/5 — smaller format; margin per unit lower than 330ml Can; acceptable at scale), Operational Fit (4/5 — PET production feasible in-market). Total: 26/30 — above progression threshold.
Field 5: Final Pack Solution	Coca-Cola No Sugar 250ml PET at SGD 1.20 RSP in CVS. Channel focus: CVS only in Phase 1 (7-Eleven, Cheers, FairPrice Xpress). SKU clarity: No Sugar only in Phase 1 — no Original variant at this size, to maintain clear health positioning for the CVS younger consumer. POSM: shelf tag highlighting "No Sugar" and "SGD 1.20" — dual message targeting both the health-conscious and price-aware consumer. Cooler placement: eye-level in the cold zone alongside RTD tea competitors — not in the SSD section where the consumer has already made a brand decision.
Field 6: Execution Approach	Trade sell-in: 250ml PET positioned to CVS buyers as incremental to the 330ml Can — different occasion (trial vs. regular), different shelf location (health-adjacent vs. SSD bay), different consumer target (lapsed/new vs. existing buyer). Distributor briefing: clear RSP enforcement at SGD 1.20; no discounting permitted in first 90 days. In-store: cooler placement standard confirmed before launch — eye-level, cold, health zone. Digital activation: CVS app promotion for first 2 weeks; trial-purchase incentive (e.g., buy 2 earn 1 free) timed to drive initial basket penetration. KPI tracking: weekly CVS offtake data from retailer partnership; cannibalization weekly read from 330ml NS volume.
Field 7: Results	[ILLUSTRATIVE — specific results not available in source materials.] Indicative Year 1 targets (based on source material frameworks): Trial rate among target segment (18–35, CVS regular shoppers): ≥15% within 90 days of launch; Cannibalization of 330ml No-Sugar Can: ≤30% of 250ml incremental volume; Numeric distribution in CVS Phase 1 outlets: ≥90% within 30 days; Repeat purchase rate at 90 days: ≥25% of trial purchasers. [FLAG: Singapore RGM team to provide actual volume and result data for verified Case Library entry.]
Field 8: Key Learnings	(Design-phase learnings; result-based learnings pending) (1) In a health-regulation context (Nutri-Grade D for Original), No-Sugar variants are the primary recruitment vehicle — not a premium extension. Entry pack design and price strategy should be engineered for No-Sugar from the ground up, not adapted from existing Original-variant logic. (2) CVS placement strategy matters more than price point in Singapore: being in the RTD tea cold zone (health positioning) rather than the SSD bay (brand positioning) changes the consumer comparison set and drives higher trial intent among the target segment. (3) Portion-right sizing (250ml vs. 330ml) for a first-trial occasion lowers consumer risk and is a replicable principle for any market where a new category or variant (No-Sugar, Zero-Calorie, New Flavour) is being recruited to a sceptical or unfamiliar consumer.

Field 9: Transferability	High transferability to: (a) markets with active health-labelling regulation or consumer health consciousness trend (Hong Kong, Taiwan, Australia, Japan, Thailand urban CVS); (b) CVS-dominant channels in any market where No-Sugar variants are below 15% of SSD volume — indicating penetration headroom; (c) markets where water and RTD tea are the primary competitive set for the target young consumer, and No-Sugar SSD can credibly compete at the RTD tea price point. Key transfer conditions: No-Sugar variant with consumer-acceptable taste profile available; CVS cold infrastructure confirmed; Health-adjacent shelf placement feasible in target CVS retailer.

Chapter 7 Governance & Ways of Working

7.1 Why Governance Matters for Pack Decisions

Recruitment and Affordability pack decisions sit at the intersection of Consumer, Commercial, Finance, Supply Chain, Marketing, and Bottler interests. Without clear governance, three failure modes recur: (1) decisions are made at the wrong level — a country manager approves a new pack without Financial and Supply Chain sign-off, creating downstream cost overruns; (2) decisions are made too slowly — multiple sequential approvals add 3–6 months to what should be a 90-day pilot cycle; (3) decisions are reversed without clear criteria — a pack that is underperforming is extended rather than exited, consuming trade investment and distribution capacity.

The governance model in this chapter is designed to prevent all three. It assigns clear decision rights, defines approval levels, and creates a transparent stage-gate process that moves at commercial speed without bypassing financial and operational safeguards.

7.2 Regional vs. Local Decision Rights Matrix

Decision	Market RGM Lead	Country GM / Commercial Director	Regional RGM Lead	Global RGM CoE	Finance CFO
New pack pilot (in business case boundary)	Recommends	APPROVES	Informed	Informed	Signs off NPV
New pack national rollout	Recommends	Recommends	APPROVES	Informed	APPROVES budget
Pack Exit decision	Recommends	APPROVES	Informed	Informed	Informed
EPP / RSP change >5%	Recommends	APPROVES	Informed	Informed	Signs off margin impact
Trade investment >market threshold	Recommends	Recommends	N/A	N/A	APPROVES
New pack type (format not in current portfolio)	Recommends	Recommends	APPROVES	APPROVES	Signs off VC analysis
Case Library submission (replication)	SUBMITS	Endorses	Reviews quality	PUBLISHES	N/A
Playbook revision	Input	Input	Input	OWNS	Input

7.3 Governance Model and Stage-Gate Flow

7.3 Governance Model and Stage-Gate Flow

Figure 7.1 — Pack Initiative Governance Stage-Gate (6 Gates)

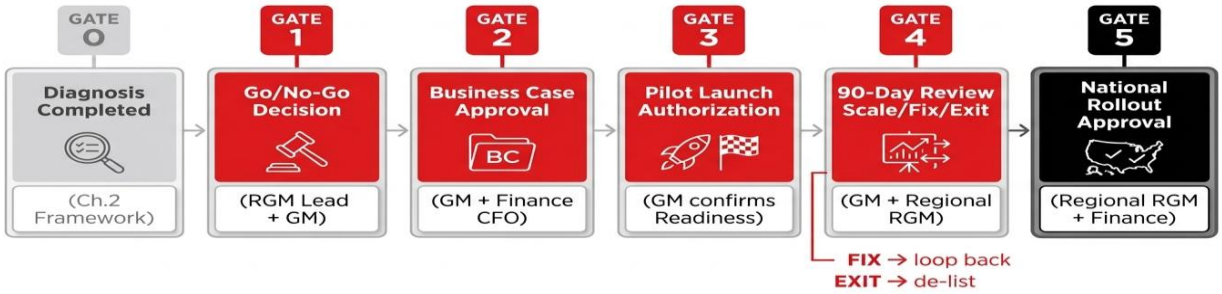

Figure 7.1 — Pack Initiative Governance Stage-Gate (6 Gates)

7.4 RACI Matrix — Full Function Responsibilities

Activity	RGM Lead	Commercial Dir.	Finance CFO	Marketing	Supply Chain	Sales Lead	Trade Mktg	Regional RGM	Bottler Mgt
Market Diagnosis (Ch.2)	R/A	C	C	C	I	C	C	I	I
Business Case Build	R	A	R/A	C	C	C	I	I	C
Gate 1 Go/No-Go Decision	R	A	C	C	C	I	I	I	C
Pack Design (6-Dimension)	R/A	C	C	R	C	I	I	I	C
Gate 2 Business Case Approval	R	R	A	C	C	I	I	I	C
Pre-Launch Readiness	A	C	I	R	R	R	R	I	R
Distribution Drive	I	C	I	I	C	R/A	R	I	R
Gate 3 Launch Authorization	R	A	C	C	C	C	C	I	C
POSM Deployment	I	I	I	R/A	I	I	R	I	I
KPI Tracking & Reporting	R/A	C	C	I	I	R	I	I	I
Gate 4 Scale/Fix/Exit Decision	R	A	C	I	C	C	I	R	C
Case Library Submission	R/A	C	I	I	I	I	I	C	I
National Rollout Planning	R	A	C	R	R	R	R	A	R

RACI Key: R = Responsible (does the work). A = Accountable (signs off). C = Consulted (provides input). I = Informed (receives update).

7.5 Ways of Working — Key Principles

Principle	Description
Cross-functional from Day 1	Any pack initiative above pilot stage requires Marketing, Finance, Supply Chain, Sales, and Trade Marketing in the room from inception — not sequential sign-off. The Spain affordability case demonstrates that this is the single most powerful accelerator of commercial speed.
One owner per stage gate	Each stage gate has a single accountable decision-maker. Shared accountability is no accountability. The decision owner is named in the project brief before work begins.
Progress over perfection	A launch with 80% of the ideal execution plan is superior to waiting for 100% readiness in a time-sensitive affordability or competitive context. The remaining 20% is added in the first 30 days.
Define exit criteria before launch	The Scale/Fix/Exit decision triggers must be agreed and documented before the pilot launches. This prevents the most common governance failure: extending a failing pack beyond its diagnostic window.
Bottler as co-owner	In all SCC markets, the bottler is a co-owner of pack performance — not a delivery vehicle. Bottler briefing, alignment, and joint KPI ownership must be in place before launch day.
Case Library as system asset	Every pack initiative — success or failure — must generate a Case Library entry within 30 days of the 90-day review. Learnings not codified are learnings lost. The RGM CoE maintains the global Case Library and publishes updates to the Playbook quarterly.

7.6 Recertification and Playbook Governance

Parameter	Standard
Recertification cycle	Every 18 months for all certified practitioners
Standards owner	RGM Centre of Excellence (CoE)
Local delivery	Market RGM Lead administers and schedules assessment sessions
Playbook revision cadence	Major revision: annual; Minor additions (Case Library, flag resolutions): quarterly
Case Library update	New cases added within 30 days of 90-day review completion; minimum 2 new cases per market per year
Partial credit	Contribution of a documented market case study accepted as partial Stage 5 credit (must pass Quality Review by Regional RGM)
Prerequisite	Each Stage requires pass of prior Stage assessment before proceeding
Failed certification	Full retake required after minimum 3-month interval

Chapter 8 Tools, Templates & Appendix

8.1 Template Index

Template	Chapter Reference	Purpose
Market Diagnosis Workbook (T-01)	Ch.2	5-step diagnosis framework with guided questions and output tables for each step
Price-Pack Ladder Mapping Template (T-02)	Ch.2	Channel-by-channel price ladder with CEP identification and competitive scan fields
6-Dimension Evaluation Scorecard (T-03)	Ch.3	Weighted scorecard for pack options; minimum score thresholds; blocking factor flags
Pack Business Case Template (T-04)	Ch.3	Structured 9-section business case format; system economics; NPV model
Pre-Launch Readiness Checklist (T-05)	Ch.4	15-item cross-functional readiness checklist with owner and status fields
90-Day Launch Timeline Template (T-06)	Ch.4	Week-by-week activity plan with KPI milestones for the first 90 days post-launch
KPI Dashboard Template (T-07)	Ch.5	Leading / Mid-term / Lagging KPI table with target benchmarks and review cadence
Scale / Fix / Exit Decision Template (T-08)	Ch.5	90-day review decision framework with trigger conditions and required actions
Case Library Submission Form (T-09)	Ch.6	Mandatory 9-field case template for all market pack initiatives
RACI Matrix Template (T-10)	Ch.7	Blank RACI matrix for market-specific function customization
DDI and Affordability Benchmark Calculator (T-11)	Ch.2	Spreadsheet-based DDI benchmarking and EPP calculation tool
Sell-In Story Template (T-12)	Ch.4	Structured 6-section distributor sell-in story format

8.2 Template T-01: Market Diagnosis Workbook

Section	Field	Data Required
Step 1: Affordability Context	DDI (avg, by segment)	Source: Household panel / census / OU Finance estimate
	Inflation trend (12–24 months, food & bev)	Source: Central bank / statistical bureau
	Affordability Index (current entry pack ÷ local MPP × 100)	Calculate from internal pricing data
Step 2: Category & Brand Participation	Category penetration (%HH, past 3 months)	Source: Kantar/Nielsen Household Panel
	Brand penetration (%HH, past 3 months)	Source: Kantar/Nielsen Household Panel
	Entry-point participation (%	Source: Panel or internal estimate

Section	Field	Data Required
	buyers below EPP)	
	Purchase frequency (avg buys/buyer/year)	Source: Panel
Step 3: Price-Pack Ladder	Full portfolio by channel (price / size / type)	Source: Internal pricing data + outlet audit
	Competitive packs by channel (price / size / type)	Source: Nielsen RMS / outlet audit
	CEP gaps identified	Analyst interpretation from above
Step 4: Channel & Occasion	Channel-specific affordability assessment	For each priority channel: GT / MT / CVS / E&D
	Consumer mission by channel (IC vs. FC; on-the-go vs. at-home)	Source: Consumer research or management estimate
Step 5: Problem Classification	Primary problem type (Brand / Price / Pack / Execution)	Analyst conclusion from Steps 1–4
	Go / No-Go decision	Decision with rationale; owner and date

8.3 Template T-03: 6-Dimension Evaluation Scorecard

Dimension	Scoring Criteria (1–5)	Score	Weight	Weighted	Notes
Consumer Fit	1=No research; 2=Management estimate only; 3=Proxy/indirect data; 4=Conjoint data; 5=Conjoint + panel validation		×2.0		
Occasion Fit	1=Unclear occasion; 2=Multiple occasions stated; 3=One occasion defined; 4=Occasion validated with consumer data; 5=Occasion + channel match confirmed		×1.0		
Channel Fit	1=RTM unable to serve; 2=Major gaps; 3=Achievable with significant work; 4=Achievable within 90 days; 5=RTM ready; distribution target confirmed		×1.5		
Brand Fit	1=Below brand price floor; 2=Borderline; 3=Above floor but no brand review; 4=Brand reviewed; 5=Brand endorsed and design approved		×1.0		
Economic Fit	1=GP% below threshold; 2=GP% meets threshold but NPV negative; 3=NPV positive at base case only; 4=NPV positive at 80% of base; 5=NPV positive in downside scenario		×2.0		
Operational Fit	1=New production line required, not justified; 2=Significant SC gaps; 3=SC achievable with moderate investment; 4=SC ready; moderate investment justified; 5=No new investment required; SC confirmed		×1.5		
TOTAL	Minimum 20/30 weighted to proceed to business case. Any score of 1 = blocking factor.			/30	

8.4 Template T-09: Case Library Submission Form

Field	Content Required (Guidance)
Field 1: Market Context	Market income level, channel structure, category maturity, DDI range, key competitive context (3–5 sentences)
Field 2: Business Problem	Specific problem identified through diagnosis — problem type (brand/price/pack/execution), where the gap sits, quantified if possible (e.g., penetration gap, price vs. DDI delta)
Field 3: Why This Pack Type	Rationale for choosing the pack solution — why this format, size, price, and channel; what alternatives were considered and why rejected
Field 4: Analysis and Tools Used	List the analytical tools applied: conjoint, price elasticity, cannibalization model, 6-dimension scorecard, business case template. Include key data outputs where available.
Field 5: Final Pack Solution	Exact pack specification: format, size, EPP, RSP, channel(s), launch date
Field 6: Execution Approach	How the pack was commercialized: distribution drive, POSM, incentive mechanics, distributor briefing, timeline
Field 7: Results	Quantified outcomes (volume vs. plan, penetration delta, cannibalization rate, NSR impact, system GP). Mark as [ILLUSTRATIVE] if not from verified source data.
Field 8: Key Learnings	Top 3–5 learnings, written as principles applicable beyond this market (not just "what happened in this market")
Field 9: Transferability	Explicit assessment of which markets or contexts this case transfers to, and what the key enabling conditions are

8.5 Quick Reference: Key Formulas and Benchmarks

Formula / Benchmark	Definition / Standard
Affordability Index	Current Entry Pack Price ÷ Local Magic Price Point × 100. Target range: 80–110. Above 110 = affordability intervention required.
DDI Benchmark	Entry pack should represent 3–6% of Daily Disposable Income in most emerging markets. Recalibrate annually. Validate market-specific with Consumer Research.
Cannibalization Threshold	Standard threshold: <30% of new pack volume from existing packs. Market-specific thresholds may be tighter (e.g., high-margin adjacent pack) or looser (e.g., low-margin existing pack being replaced).
Trial Rate Target	≥15% of target non-buyer segment in pilot channel within pilot period (typically 60–90 days).
Repeat Purchase Rate Target	≥20% of trial buyers purchasing again within 4 weeks of first trial.
EPP Compliance Rate	≥85% of audited outlets selling at or below defined EPP at 30 days.
Numeric Distribution Target	≥60% of priority target outlets reached by Week 1; ≥80% by Week 4.
Business Case NPV Threshold	Positive NPV at Year 3 under 80% of base volume scenario.
GP Margin Floor	Market-specific (typically 28–35% GP per case for recruitment packs). Minimum must be confirmed with Finance before pack design approval.
Scale/Fix/Exit Trigger	SCALE: ≥80% of volume target at 90 days + all other thresholds met. FIX: 50–80%. EXIT: <50% after Fix cycle attempted.

Training Programme T1–T5: Five-Stage Certification Programme

Programme Overview

The RGM Recruitment Pack Training and Certification Programme is a five-stage, role-differentiated capability journey covering the full analytical and commercial skill set required to design, deploy, and measure Recruitment and Affordability Pack initiatives across any Swire Coca-Cola market.

Stage	Title	Target Audience	Assessment Type	Certification Level
Stage 1	Foundation	Associate / Analyst	MCQ (20 questions) + 1 mini case diagnosis	—
Stage 2	Market Diagnosis & Analytics	Manager / Senior Analyst	Data interpretation test (30 min) + written case analysis (45 min)	Foundation Certified (S1+S2)
Stage 3	Pack Design & Business Case	Senior Manager	Pack selection exercise + business case build	Practitioner Certified (S1–3)
Stage 4	Commercialization & Execution	RGM Lead	Launch plan design + 90-day action plan	—
Stage 5	Certification (End-to-End)	All levels (cumulative)	Written assessment + full market case + panel presentation	Advanced / Market Deployment Certified (S1–5)

Composite Scoring Model

Figure T.1 — Composite Scoring Model: Stage 5 Certification Weighting

Figure T.1 — Composite Scoring Model: Stage 5 Certification Weighting

Component	Weight	What Is Tested
Knowledge	20%	Core definitions, framework concepts, key principles from all 4 stages (Ch.1–Ch.5)
Analytics	25%	Ability to diagnose a market from data: DDI, penetration, price-pack ladder, problem classification
Pack Design & Business Case	25%	Application of 6-dimension framework; business case construction; EPP and system economics
Execution Plan	20%	Launch readiness checklist; 5 non-negotiables; 90-day timeline; KPI architecture

Component	Weight	What Is Tested
Presentation Defense	10%	Communication clarity; recommendation quality; ability to defend under senior scrutiny

STAGE 1 OF 5

Foundation

Audience: Associate / Analyst

Learning Objective

Build a shared language and baseline understanding of Recruitment and Affordability Packs, their strategic role within RGM and OBPPC, and the most common success and failure patterns.

Module	Topics Covered
Module 1A: What Is a Recruitment Pack? What Is an Affordability Pack?	Definitions; critical distinctions between the two pack types; why the distinction matters for strategy, channel deployment, and measurement. The two-engine growth model (recruitment vs. retention).
Module 1B: Why It Matters in RGM	Link to OBPPC and Price-Pack Architecture. Occasion-based portfolio design. Long-term revenue pool development logic. RGMX context: margin expansion alongside revenue growth.
Module 1C: Success Factors and Failure Traps	The 8 Do / Do Not principles (Ch.1). Common misuses: treating small packs as a universal solution; measuring volume only; ignoring mix and cannibalization. Key questions senior leadership will ask.

Assessment Parameter	Detail
Format	Multiple choice (MCQ) — 20 questions + 1 mini case diagnosis
Pass mark	75% or above to proceed to Stage 2
Duration	45 minutes
Retake policy	One retake permitted after 2-week waiting period

Stage 1 Sample Questions

Q1. Which of the following best describes the PRIMARY purpose of a Recruitment Pack?

A. To protect existing heavy buyers from trading down during inflationary periods

B. To acquire new or lapsed consumers by removing the trial barrier through price or portion

C. To drive frequency among existing light buyers by offering a larger pack at lower price per liter

D. To differentiate portfolio presentation between Modern Trade and General Trade channels

Correct Answer: B | Chapter: Ch.0 / Ch.1

A Recruitment Pack's primary purpose is consumer acquisition — removing the entry barrier (price or portion) for non-buyers and lapsed buyers. Option A describes an Affordability Pack. Option C describes a Frequency Pack mechanic. Option D describes OBPPC channel differentiation, which is a deployment decision, not a pack type definition.

Q2. The Affordability Index formula is defined as:

A. DDI ÷ Current Pack Price × 100

B. Current Pack Price ÷ Local Magic Price Point × 100

C. NSR per case ÷ GP per case × 100

D. Penetration Rate ÷ Category Average × 100

Correct Answer: B | Chapter: Ch.2 / Ch.8

Affordability Index = Current Entry Pack Price ÷ Local Magic Price Point × 100. An index above 110 signals meaningful affordability stress requiring intervention. This formula is used in Step 1 of the Market Diagnosis framework (Ch.2).

Q3. A market team identifies that category penetration is 65% but brand penetration is only 38%, with no price-sensitivity signal in consumer research. The most likely problem classification is:

A. Pack Problem — the wrong format is blocking recruitment

B. Execution Problem — distribution is insufficient

C. Brand Problem — consumers are buying the category but not the brand

D. Price Problem — the brand is priced above the affordability threshold

Correct Answer: C | Chapter: Ch.2

The gap between category penetration (65%) and brand penetration (38%) indicates consumers are in the category — they have purchasing power and category engagement — but choosing competing brands. The absence of a price-sensitivity signal rules out a Price Problem. A Brand Problem requires Marketing and equity investment, not a new pack.

Q4. Which of the following is a BLOCKING FACTOR in the 6-Dimension Evaluation Framework, regardless of total score?

A. A Consumer Fit score of 3 without conjoint validation

B. An Operational Fit score of 4 requiring moderate supply chain investment

C. Any single dimension scoring 1

D. An Economic Fit score below 4

Correct Answer: C | Chapter: Ch.3

Per the 6-Dimension scoring rules: any dimension scoring 1 is a blocking factor, regardless of total weighted score. A score of 1 indicates the pack cannot meet the minimum threshold on that dimension without fundamental redesign. The total score minimum of 20/30 applies in addition to this blocking factor rule.

Q5. The "Five Non-Negotiable Execution Conditions" for a Recruitment Pack launch are:

A. Right Outlet, Right Price, Right Visibility, Right Incentive, Right Replenishment

B. Right Brand, Right Pack, Right Channel, Right Consumer, Right Occasion

C. Right Distribution, Right POSM, Right Trade Investment, Right Timing, Right Message

D. Right Target, Right Metric, Right Timeline, Right Owner, Right Budget

Correct Answer: A | Chapter: Ch.4

The Five Non-Negotiables are: Right Outlet (numeric distribution target met), Right Price (RSP at EPP), Right Visibility (POSM placed correctly), Right Incentive (active from Day 1), Right Replenishment (no stockout tolerance in first 60 days). These are minimum conditions without which the pack cannot function as intended.

STAGE 2 OF 5

Market Diagnosis & Analytics

Audience: Manager / Senior Analyst

Learning Objective

Enable participants to independently assess whether a market has an affordability or recruitment gap, locate where the gap sits, and determine whether a pack intervention is the right response.

Module	Topics Covered
Module 2A: Affordability Diagnosis	Market affordability context: income, inflation, purchasing power, price sensitivity. Category and brand participation: penetration, frequency, entry-point participation. Affordability Index methodology and benchmark interpretation. DDI benchmarks and Magic Price Points.
Module 2B: Price Ladder & Competitive Mapping	Price-pack ladder mapping: identifying missing gaps. Consumer Entry Point (CEP) analysis. Competitive white space mapping and entry pack scan. The Price-Pack Ladder Mapping Template (T-02).
Module 2C: Channel & Occasion Diagnosis	Channel-specific affordability mapping. Consumer mission and cash-in-hand analysis. Cannibalization risk assessment and net revenue/margin bridge. Opportunity heatmap methodology.
Module 2D: Problem Classification	Brand problem vs. price problem vs. pack problem vs. execution problem. Go/No-Go decision criteria: when not to solve with a pack. The Go/No-Go Decision Tree (Ch.2).

Assessment Parameter	Detail
Format	Data interpretation test (30 min) + case-based written analysis (45 min)
Pass mark	70% combined weighted score
Key skill tested	Correct identification of problem type and root cause from a market data set
Retake policy	One retake permitted after 2-week waiting period

Stage 2 Sample Questions

Q6. A market shows the following data: Category penetration 45%, Brand penetration 42%, brand entry-pack price index vs. DDI = 128, lapsed buyer rate +8% in the last 12 months. What is the most likely diagnosis?

A. Brand problem: brand penetration gap too large despite close category parity

B. Execution problem: distribution must be insufficient given high lapsed buyer rate

C. Price problem: pack price above DDI threshold is creating an affordability barrier

D. Pack problem: wrong format is driving consumers to lapse

Correct Answer: C | Chapter: Ch.2

Brand penetration (42%) is close to category penetration (45%) — there is no significant brand gap. The Affordability Index of 128 (>110 = intervention required) clearly signals that the entry pack price has drifted above the affordability threshold. The lapsed buyer rate increasing (+8%) is consistent with existing consumers exiting due to price pressure, not a new-buyer recruitment problem.

Q7. In a price-pack ladder mapping exercise, you identify a gap at the 3–4% DDI range with no own or competitive pack present. This gap is most likely to represent:

A. An opportunity to premiumize — insert a higher-price format to capture willing-to-pay consumers

B. An Entry Price Point (EPP) white space — potential recruitment pack opportunity at the Magic Price Point

C. A cannibalization risk — any pack inserted here would draw volume from adjacent packs

D. A distribution problem — the pack exists but is not reaching target outlets

Correct Answer: B | Chapter: Ch.2

A gap at the 3–4% DDI range where no pack exists from you or the competition is precisely the definition of an EPP white space — a potential recruitment opportunity. The absence of competitive occupancy makes this higher-priority (no competitive risk to moving first). Cannibalization and distribution are separate steps in the analysis.

Q8. Which of the following data sources is MOST appropriate for measuring household penetration growth as a result of a Recruitment Pack launch?

A. Nielsen Retail Measurement Service (RMS)

B. Distributor sell-in data

C. Kantar/Nielsen Household Panel data

D. Internal shipment data (cases dispatched)

Correct Answer: C | Chapter: Ch.2 / Ch.5

Household penetration requires household-level purchase data — which is only available from a household panel (e.g., Kantar WorldPanel or Nielsen Household Panel). Nielsen RMS measures store-level volume, not household purchase behavior. Distributor sell-in and internal shipments measure supply-chain movement, not consumer purchase.

STAGE 3 OF 5

Pack Design & Business Case

Audience: Senior Manager

Learning Objective

Develop the ability to design and evaluate pack options systematically, build a defensible business case, and present a recommendation that balances consumer, channel, brand, and economic requirements.

Module	Topics Covered
Module 3A: Six-Dimension Evaluation Framework	Consumer fit, Occasion fit, Channel fit, Brand fit, Economic fit, Operational fit. Design sequence: start from target transaction price — not from the pack. Using the Evaluation Scorecard (T-03).
Module 3B: Pack Selection Tools	Pack selection decision tree: entry barrier vs. repeat barrier. Price bridging methodology and optimal EPP identification. Volume-price elasticity: incrementality vs. substitution modelling. Pack evaluation scorecard (weighted, multi-criteria).
Module 3C: Business Case Design	Expected recruitment and incrementality estimation. Margin impact and cannibalization assessment. Required trade investment, customer economics, break-even / payback. Using the Business Case Template (T-04).

Assessment Parameter	Detail
Format	Select best pack from structured options + build simplified business case
Pass mark	Rubric-scored: 70% minimum across all criteria
Key skill tested	Structured recommendation logic and economic defensibility
Retake policy	One retake permitted after 2-week waiting period

Stage 3 Sample Questions

Q9. The pack design principle "start from the target transaction price, not from the pack" means:

A. Always design the smallest possible pack regardless of consumer research

B. Establish the Entry Price Point (EPP) first based on DDI and Magic Price Point, then determine the optimal format and size that delivers the right experience at that price

C. Set the RSP equal to the DDI benchmark percentage before designing the pack format

D. Price the pack 10% below the nearest competitive entry pack regardless of consumer research

Correct Answer: B | Chapter: Ch.3

The design sequence starts with EPP determination (DDI benchmark + Magic Price Point + competitive context), then works backward to identify which pack format and size can deliver the right consumer experience at that price while meeting margin thresholds. Starting from an existing pack and applying a price reduction is a common error that generates affordability without genuine entry-point innovation.

Q10. A pack scores 4/5 on Consumer Fit, 4/5 on Channel Fit, 4/5 on Brand Fit, but 1/5 on Economic Fit because the GP% is below the market threshold. What is the correct action?

A. Proceed: the total score of 17/25 exceeds the 20/30 minimum when weighted
B. Block: Economic Fit score of 1 is a blocking factor regardless of total score; redesign required
C. Approve with a monitoring condition on margin performance
D. Escalate to the Regional RGM Lead for a final decision
Correct Answer: B | Chapter: Ch.3 *Any dimension scoring 1 is a blocking factor, regardless of total weighted score or other dimension performance. A GP% below the market threshold means the pack does not meet the minimum economic viability standard. The correct action is to redesign — either by adjusting the pack format to reduce production cost, revising the EPP, or adjusting the value chain economics before resubmitting.*

STAGE 4 OF 5

Commercialization & Execution

Audience: RGM Lead

Learning Objective

Translate a pack decision into a market-ready launch plan — from pre-launch readiness through sell-in to sell-out, with clear KPI ownership and a structured optimization process.

Module	Topics Covered
Module 4A: Pre-Launch Readiness	Target channel prioritization and RTM readiness assessment. Supply, S&OP, pricing architecture, and commercial policy alignment. Customer proposition and sell-in story development. The Pre-Launch Readiness Checklist (T-05).
Module 4B: Launch Design & Execution Standards	Outlet segmentation and numeric distribution targets. Five non-negotiables: right outlet, price, visibility, incentive, replenishment. POSM requirements, trial mechanics, and perfect store standards.
Module 4C: Sell-In to Sell-Out Closed Loop	Distributor briefing and sales toolkit deployment. Outlet compliance tracking and early-read monitoring. Rapid issue escalation and corrective action protocols.
Module 4D: KPI Tracking & Optimization	Leading / Mid-term / Lagging KPI architecture. Incrementality judgment: recruitment vs. cannibalization vs. redistribution. Pilot-to-scale optimization loop. Scale/Fix/Exit decision rules and triggers.

Assessment Parameter	Detail
Format	Launch plan design (structured template) + 90-day action plan
Pass mark	Panel-scored rubric: 70% minimum
Key skill tested	Execution completeness, channel specificity, KPI clarity
Retake policy	One retake permitted after 2-week waiting period

Stage 4 Sample Questions

Q11. A pack has launched 30 days ago. Numeric distribution is 75% (target: 80%). EPP compliance is 92%. POSM compliance is 88%. Stockout rate is 3%. Repeat purchase rate among trial buyers is 22%. What is the correct 30-day action?

A. Exit: the pack is not meeting numeric distribution target and should be de-listed

B. Scale immediately: all other KPIs are on track or above target

C. Fix: close the 5pp ND gap in targeted Tier 1 outlets while maintaining current momentum on other metrics

D. Hold: wait until 60-day review before taking any action

Correct Answer: C | Chapter: Ch.4 / Ch.5

ND at 75% vs. 80% target is a single specific gap — and all other metrics are on or above target (EPP 92%≥85%, POSM 88%≥80%, stockout 3%<5%, repeat 22%≥20%). This is a Fix situation for one specific metric, not an Exit. The correct action is targeted: close the 5pp ND gap in specific outlets where coverage is missing. Scaling or holding without addressing the gap risks under-delivering on the volume target.

Q12. Which of the following is the correct "Scale / Fix / Exit" trigger at the 90-day review?
A. SCALE if volume is ≥50% of business case target and any two of the five non-negotiables are met
B. FIX if volume is 50–80% of target and one or two specific execution failure modes are identified
C. EXIT if volume is <80% of target regardless of the reason
D. SCALE if NSR per case is above forecast even if volume is below target
Correct Answer: B | Chapter: Ch.5 *FIX is triggered when volume is 50–80% of target AND there are specific, identifiable failure modes — meaning the problem is diagnostic and fixable within 30 days. SCALE requires ≥80% of volume target PLUS all other thresholds met. EXIT requires <50% after a Fix cycle has been attempted, OR cannibalization/margin threshold breach. Option C is incorrect: volume at 70% of target with an identifiable fix is not an Exit.*

STAGE 5 OF 5

Certification — End-to-End Assessment

Audience: All levels (cumulative)

Learning Objective

Confirm that the participant can operate end-to-end: diagnose a market, design the right pack, build a business case, plan the launch, and defend their recommendation under senior scrutiny.

Component	Description	Duration
Component A: Written Assessment	Theory, analytical logic, and commercial judgment. Covers content from all four stages. 20 MCQ + 4 data interpretation questions.	60 minutes
Component B: Full Market Case	Participants receive a realistic market scenario (new brief per cohort). Required deliverables: market diagnosis, pack recommendation, business case, launch plan, KPI plan. Maximum 10 pages.	5 business days preparation
Component C: Panel Presentation & Defense	10–15 minute presentation to a minimum 2-person senior panel (Regional RGM + one additional senior reviewer). Followed by 10 minutes challenge questions.	25 minutes total

Assessment Parameter	Detail
Composite scoring	20% Knowledge | 25% Analytics | 25% Pack Design & Business Case | 20% Execution Plan | 10% Presentation Defense
Pass mark	70% composite score; no single component below 55%
Certification awarded	Within 2 weeks of panel review completion
Failed certification	Full retake required after minimum 3-month interval

Assessment Question Bank Full Bank — Stages 1–5

STAGE 1 QUESTION BANK — Foundation (20 MCQ)

Questions 1–5 above are Stage 1 sample questions. The following complete the Stage 1 bank to 20 questions.

Q6. The "Two-Engine Growth Model" in RGM refers to:
A. Volume growth and value growth as dual metrics
B. Recruitment (acquiring new consumers) and Retention (deepening value with existing consumers)
C. Modern trade growth and general trade growth as parallel channels
D. On-invoice discounts and off-invoice rebates as the two levers of trade spend
Correct Answer: B | Chapter: Ch.1 *The Two-Engine Growth Model establishes that sustainable NARTD revenue growth requires two simultaneous strategies: recruitment (bringing new consumers into the brand/category) and retention (deepening frequency, occasion breadth, and premiumization with existing buyers). Neither engine is optional.*

Q7. Under the RGMX framework (Revenue Growth & Margin Expansion), a Recruitment Pack is approved when:
A. It generates incremental volume regardless of its impact on system gross margin
B. It grows market share above the competitor's entry-price share position
C. It delivers both incremental volume AND demonstrates a credible path to positive system economics including the full value chain
D. It receives sign-off from the Country GM and Finance CFO simultaneously
Correct Answer: C | Chapter: Ch.1 *Under RGMX, margin expansion is an explicit co-equal objective alongside revenue growth. A pack that grows volume but destroys system margin is not approved under RGMX. The business case must close at the system level — covering full value chain from production through customer margin to consumer price.*

Q8. A Recruitment Pack that scores well on Consumer Fit and Channel Fit but has a GP% below the market threshold should:
A. Be approved with a 12-month monitoring condition
B. Be blocked at Economic Fit — any dimension scoring 1 is a blocking factor
C. Be submitted to Regional RGM for special approval given strong consumer metrics
D. Be launched in a limited pilot without a formal business case
Correct Answer: B | Chapter: Ch.3 *Economic Fit score of 1 (GP% below threshold) is a blocking factor regardless of performance on other dimensions. No approval path exists for a pack that fails the minimum economic threshold. The correct action is redesign: adjust*

the pack format, cost structure, or EPP until the Economic Fit score clears the minimum.

Q9. The correct sequence in the OBPPC logic tree is:

A. Pack Format → Brand → Price → Channel → Consumer Insight → Execution

B. Consumer & Shopper Insight → Brand Role → Pack Role → Pack Format → Price Architecture → Channel → Execution → Measurement

C. Price Architecture → Consumer Insight → Pack Role → Brand Role → Channel → Execution

D. Channel → Consumer Insight → Pack Format → Price → Brand → Execution → Measurement

Correct Answer: B | Chapter: Ch.1

The OBPPC logic tree always starts with Consumer and Shopper Insight (occasion and need), flows through Brand Role, then Pack Role assignment, Pack Format, Price Architecture, Channel deployment, Execution Standards, and Performance Measurement. Starting from price or channel (Options C and D) is a common strategic error that produces pack designs disconnected from consumer insight.

Q10. A "Magic Price Point" is best defined as:

A. The lowest possible price at which a pack can be produced and still generate positive GP margin

B. A psychologically significant price threshold at which consumer transaction propensity increases disproportionately

C. The price at which 50% of target consumers indicate willingness to purchase in conjoint research

D. The price point at which the pack becomes the cheapest option in its channel and category

Correct Answer: B | Chapter: Ch.0 / Ch.2

A Magic Price Point is a market-specific, psychologically significant threshold (e.g., IDR 3,000; INR 20; PKR 100) where consumer purchasing behavior shifts disproportionately — driven by cognitive price anchors, cash denomination convenience, and category reference prices. It is not simply the cheapest price or the minimum margin price.

Q11. Which statement about cannibalization is CORRECT?

A. Cannibalization must be zero for a Recruitment Pack to be approved

B. A standard cannibalization threshold of <30% of new pack volume from existing packs applies, but market-specific thresholds may vary

C. Cannibalization is only relevant if the affected existing pack has a higher GP% than the new pack

D. Cannibalization is acceptable up to 50% of new pack volume in any context

Correct Answer: B | Chapter: Ch.0 / Ch.5

The standard benchmark threshold is <30% of new pack volume drawn from existing packs, but this must be calibrated to the specific market context — particularly if the adjacent pack has significantly higher margin. The key principle is that cannibalization is expected and must be modelled explicitly before launch; the threshold determines whether the business case remains positive net of cannibalization.

Q12. The primary difference between an "Entry Pack" and a "Frequency Pack" in OBPPC architecture is:

A. Entry Pack has a lower GP% by definition; Frequency Pack has a higher GP%

B. Entry Pack targets new/lapsed consumers by removing trial barriers; Frequency Pack drives repeat purchase by existing light-to-medium buyers

C. Entry Pack is always a smaller format than Frequency Pack

D. Entry Pack is sold only in General Trade; Frequency Pack is sold in Modern Trade

Correct Answer: B | Chapter: Ch.1

Pack role is defined by strategic intent and target consumer — not by size or channel. An Entry/Recruitment Pack targets consumer acquisition (non-buyers and lapsed buyers) by removing trial barriers through price or portion. A Frequency Pack targets repeat purchase behavior among existing lighter buyers. The same physical pack format could theoretically serve either role depending on its price point and channel deployment.

Q13. Which of the following best describes "Daily Disposable Income" (DDI) as used in RGM?

A. Total annual household income divided by 365 days

B. The amount a consumer has available to spend on discretionary FMCG items per day after fixed costs

C. The median daily income of the lowest income quintile in the target market

D. The amount required to purchase the brand's current entry pack

Correct Answer: B | Chapter: Ch.0 / Ch.2

DDI in the RGM context refers to the daily income available for discretionary spending — after fixed costs (rent, transport, utilities, staple food) — rather than total daily income. It is the operative affordability ceiling for impulse and NARTD purchases. The 3–6% of DDI benchmark for entry pack price refers to this discretionary portion, not total income.

Q14. The primary reason to "define exit criteria before launch" is:

A. To satisfy Finance requirements for budget approval

B. To prevent the most common governance failure: extending a failing pack beyond its diagnostic window and wasting trade investment

C. To enable the Regional RGM Lead to override a market decision if performance is below target

D. To satisfy the Stage 4 Training & Certification assessment requirement

Correct Answer: B | Chapter: Ch.1 / Ch.7

Pre-defining exit criteria prevents the most common governance failure: "launch and hope" without clear trigger points. Without pre-agreed criteria, teams consistently extend failing packs — consuming distribution space, trade investment, and management attention — rather than making a clear Fix or Exit decision. The criteria must be agreed before the pilot, not during or after.

Q15. A participant asks: "Should we launch a Recruitment Pack to address an Execution Problem (poor POSM compliance and distributor stockouts)?" The correct answer is:

A. Yes — a new pack with a lower price will drive trial regardless of execution issues
B. No — a new pack will fail for the same execution reasons as the existing pack; execution must be fixed first
C. Possibly — pilot the new pack in well-executed outlets first to determine if the problem is execution or pack
D. Yes — but only in Modern Trade where execution is more controllable
Correct Answer: B | Chapter: Ch.2 *The Go/No-Go Decision Tree explicitly excludes execution problems from the pack solution path. A new pack deployed into a broken execution environment will fail for exactly the same reasons: wrong placement, wrong price, no POSM, stockouts. Launching a new pack to "restart" a category that is underperforming due to execution is a well-documented failure mode in the Coca-Cola system.*

STAGE 2 QUESTION BANK — Market Diagnosis & Analytics (15 MCQ + 3 Data Scenarios)

Questions 6–8 above are Stage 2 samples. Additional MCQ below.

Q16. In the five-step diagnosis process, which step should ALWAYS be completed before channel diagnosis?
A. Problem Classification (Step 5)
B. Price-Pack Ladder Mapping (Step 3)
C. Affordability Context (Step 1) and Category & Brand Participation (Step 2)
D. Go/No-Go Decision (Step 5)
Correct Answer: C | Chapter: Ch.2 *Steps 1 and 2 establish the macro affordability baseline (DDI, inflation, income segments) and the category/brand participation picture. These must be completed before Step 3 (price ladder) and Step 4 (channel diagnosis) because: (a) the affordability baseline calibrates what gap threshold is meaningful; and (b) brand participation data determines whether a price/pack gap actually translates to an incremental volume opportunity.*

Q17. A market has DDI of approximately USD 6/day (urban, grocery consumer). Category DDI range for affordable single-serve IC pack = 3–5% DDI. What is the target EPP range?
A. USD 0.06 – 0.10
B. USD 0.18 – 0.30
C. USD 0.30 – 0.60
D. USD 0.60 – 1.20
Correct Answer: B | Chapter: Ch.2 / Ch.3 *3% of USD 6 = USD 0.18; 5% of USD 6 = USD 0.30. Therefore the target EPP range is USD 0.18–0.30. This maps to the Cambodia-context KHR 750–1,250 range at prevailing exchange rates, consistent with the KHR 1,000 Magic Price Point identified for Cambodia GT channel.*

Q18. The "Opportunity Heatmap" framework in Chapter 2 is used to:

A. Map competitor pack distribution by channel and segment
B. Summarize diagnostic findings across consumer segments and channels to identify priority areas for pack intervention
C. Track KPI performance over the first 90 days post-launch
D. Assign RACI responsibilities across functions for the launch plan
Correct Answer: B | Chapter: Ch.2 *The Opportunity Heatmap is a diagnostic summary tool — not a performance tracking tool. It captures the relative size of identified gaps (High/Medium/Low) by consumer segment (non-buyer, light, medium, heavy) and channel, enabling the team to prioritize where to focus pack design and commercialization effort. It is completed at the end of the Market Diagnosis (Ch.2) and informs the Channel & Occasion targeting in Pack Design (Ch.3).*

STAGE 2 — Data Interpretation Scenarios

Scenario 2-A: Market X Affordability Analysis

Market X Data: Category penetration 52%. Brand penetration 44%. Current entry pack: PET 330ml at USD 0.45. Local DDI: USD 8/day (urban). Magic Price Point for NARTD IC: USD 0.25. Competitive entry pack: local brand, 250ml PET at USD 0.25. Lapsed buyer rate: +12% YoY. Brand equity score: stable.

Question: Complete the Affordability Index calculation. Classify the problem type. State whether a pack intervention is warranted and why.

Model Answer: Affordability Index = USD 0.45 ÷ USD 0.25 × 100 = 180. This is well above the 110 threshold, confirming severe affordability stress. Brand penetration gap (52% category vs. 44% brand) is moderate; brand equity is stable — brand problem is ruled out. Rising lapsed buyer rate (+12%) with stable brand equity points to price pressure causing consumer exit. The competitive local brand at the Magic Price Point (USD 0.25) is winning on price in the IC entry segment. Classification: Price Problem. Pack intervention warranted: a new entry pack at or below USD 0.25 (3.1% of DDI) would address the EPP gap and directly compete with the local brand entry. Proceed to Step 3: Price-Pack Ladder Mapping to design the pack. Grade rubric: 30% for correct AI calculation; 30% for correct problem classification; 40% for quality of recommendation logic.

STAGE 3 QUESTION BANK — Pack Design & Business Case

Q19. In building a business case, which of the following is the correct volume estimation approach for a Recruitment Pack?
A. Total category volume × target market share gain
B. Year 1 volume = Penetration uplift target (number of new households) × Average purchase frequency × Average pack size
C. Competitor entry pack volume × your estimated distribution advantage
D. Category growth rate × number of target outlets
Correct Answer: B | Chapter: Ch.3 *Recruitment pack volume must be built from first principles: (1) how many non-buyer or lapsed-buyer households will the pack reach through the pilot channel; (2) what % will trial (trial rate target); (3) what is the average purchase frequency in the pilot period. Estimating from total category volume or competitive share overstates the opportunity because it does not account for the specific constraints of reach, trial propensity, and distribution coverage.*

Q20. A pack design starting from an existing 500ml format with a 10% price reduction is an example of:
A. Good pack design: using an existing format minimizes production cost and capex
B. A common design error: starting from the existing pack rather than from the target transaction price (EPP)
C. A Frequency Pack strategy, not a Recruitment Pack
D. An Affordability Pack approach, appropriate if the target is heavy buyer retention
Correct Answer: B | Chapter: Ch.3 *Starting from an existing pack and applying a price reduction is explicitly identified as the most common pack design error in this Playbook. It generates affordability but does not create genuine entry-point innovation. A Recruitment Pack requires starting from the EPP (DDI-anchored, Magic Price Point aligned) and working backward to the optimal format and size. A 10% price reduction on a 500ml pack typically does not reach the EPP threshold for non-buyers.*

STAGE 4 QUESTION BANK — Commercialization & Execution

Q21. A distributor in Tier 2 markets has received the new entry pack but is pricing it 15% above the defined EPP "because the transport cost to these outlets is higher." What is the correct response?
A. Accept: transport economics in Tier 2 justify a premium over the defined EPP
B. Escalate to Country GM: pricing decisions require executive sign-off
C. Address immediately: EPP compliance is one of the Five Non-Negotiables; a 15% deviation destroys the recruitment mechanic for target consumers
D. Monitor: if stockout rate is below 5%, pricing deviation is not critical
Correct Answer: C | Chapter: Ch.4 *EPP compliance is a Non-Negotiable. A 15% premium above EPP potentially takes the pack above the Magic Price Point — exactly the threshold at which trial propensity drops disproportionately. The recruitment mechanism only works if the consumer encounters the pack at or below the EPP. The correct response is immediate: diagnose the transport cost issue (consider a distributor subsidy or revised case configuration for Tier 2) and enforce RSP compliance through distributor briefing and trade audit.*

Q22. The first 90-day launch window is significant because:
A. Finance requires a quarterly review cycle for budget tracking
B. Trial velocity is highest in the first 60 days — stockouts or execution gaps in this window permanently damage recruitment momentum
C. The 90-day window aligns with the market annual planning cycle
D. Consumer research is not valid beyond 90 days after launch
Correct Answer: B | Chapter: Ch.4 *Trial velocity is highest in the first 30–60 days when novelty, POSM visibility, and distributor incentive mechanics are active. A stockout in Week 3–4 — when consumers who tried the pack in Week 1–2 want to repeat purchase — is the single most damaging execution event in the launch window. This is why the 90-day window has maximum 3-day stockout tolerance and why the replenishment cycle must be confirmed before launch.*

STAGE 5 — Certification Market Case Brief

Bangladesh Market Case Brief — Stage 5 Certification Scenario

[ILLUSTRATIVE CASE — for training purposes only. Bangladesh is used as the Stage 5 certification scenario because it does not appear as a primary case in Chapter 6, and represents a context (large, GT-dominated emerging market; high inflation; low per capita; traditional trade dominant) that tests the full end-to-end capability.]

Brief Element	Details
Market	Bangladesh
Context	Population: 170M. GDP per capita: ~USD 2,800 (2025). DDI (urban, grocery consumer): approximately BDT 400–600/day (USD 3.60–5.40). Food inflation 2024–2025: 9–11% annualized. NARTD category growing but from a low base. Traditional trade (GT) represents ~90% of NARTD volume. Modern trade is growing but concentrated in Dhaka and Chittagong. Cold chain limited outside major cities.
Category Situation	SSD category penetration: 28% (national household). Brand penetration: 19%. Current entry pack: PET 250ml at BDT 20 (equivalent to approximately 4.5% DDI for urban consumer). Magic Price Point in GT: BDT 10–15 for IC beverages. Competitive entry: local sparkling brand at BDT 12 for 200ml. Lapsed buyer rate: +18% in last 12 months. Brand equity score: stable among buyers; low awareness among non-buyers.
Business Problem	Brand penetration of 19% vs. category penetration of 28% indicates a brand recruitment gap. The current entry pack at BDT 20 is above the BDT 10–15 Magic Price Point for the GT IC occasion, creating a price barrier in the primary recruitment channel. The competitive local brand at BDT 12 has been gaining share in GT among price-sensitive light buyers and non-buyers.
Your Task	As the RGM Lead for Bangladesh, produce a complete Recruitment Pack proposal covering: (1) Market Diagnosis (use the 5-step framework); (2) Pack Recommendation (apply 6-dimension scoring; specify format, size, EPP, RSP, channel priority); (3) Business Case (volume, margin, NPV — Year 1–3); (4) Launch Plan (pre-launch readiness, 90-day timeline, five non-negotiables, KPIs); (5) Governance (decision rights, stage gates, RACI highlights). Maximum 10 pages. Prepare to present and defend in 10–15 minutes with 10 minutes Q&A.
Panel Assessment Criteria	Knowledge (20%): correct application of framework terminology; DDI benchmarking; problem classification. Analytics (25%): diagnosis quality; volume build-up logic; cannibalization modelling. Pack Design & Business Case (25%): EPP derivation from DDI; 6-dimension scoring logic; economic defensibility. Execution Plan (20%): completeness of 90-day plan; specificity of KPIs; realistic scale/fix/exit triggers. Presentation Defense (10%): clear recommendation; ability to defend against challenges on volume projection and cannibalization assumptions.
Common Challenge Questions from Panel	(1) "Your volume projection assumes 15% trial rate. What evidence supports this in a market with no prior data?" (2) "The local competitor at BDT 12 has been in market for 3 years. How will you win when you are entering at BDT 15?" (3) "Your business case shows positive NPV at Year 3 but negative in Year 1. How do you defend the trade investment in Year 1 to the CFO?" (4) "What is your Exit trigger and how will you explain an Exit to the trade after 90 days?"
